Much has been made of developing a bromide print to finality or to some fixed time, usually two minutes. It is quite impossible to fix any exact time when prints will generally have received adequate development, if only because the suitable time would differ in different brands and grades of paper. The method of developing to finality, that is, for considerably longer than is actually necessary, is not to be recommended, because there is a danger of fog and degradation of delicate tones.

Factorial Development.

The use of the factorial system is rapidly becoming recognised as the one certain method of obtaining accurate development times. A suitable factor for a normal M.Q. developer is 5, while that for amidol is 10, and the correct development time is indicated, *in the case of each print*, by multiplying the time taken for the image to appear in the developer by the factor proper to the developer. Thus, when using M.Q., if the image appears in 20 seconds, development will be complete after a total development time of 100 seconds, and similarly with other factors.

Need it be again emphasised that the temperature of the developer should not be allowed to fall below 65 degrees Fahr., particularly when M.Q. is being used?

After development the print should be given a brief but thorough rinse in clean water before being placed in the fixing bath, which should always be of the acid-hardening variety. After fifteen minutes in this bath the print should be placed in a further bath of fresh, plain hypo for another five minutes before the final thorough washing.

C. M.

DRAMATIC SKY EFFECTS *for the Novice*

By JOHN COLE.

AS soon as clouds are mentioned, the average snapshotter comes over panicky like a non-swimmer who finds himself out of his depth. He seems to have a fixed idea that clouds can be introduced into photographs only by experts who have attained a degree of skill that is far beyond his reach, and who have at their disposal time and apparatus such as he can never hope to possess.

It is a great pity that such notions should be so general, if only because it means that thousands of amateur photographers are turning out work of a lower standard of interest than they need do.

If the illustrations herewith are studied for a moment, it will be seen that they are all of common enough objects which, if taken, against a bare sky, would have no claim to beauty whatsoever. The cloud effects, however, have invested them with a dramatic interest that immediately raises them to a higher standard of excellence.

The obtaining of these cloud effects is all a matter of proper exposure and the judicious use of filters. Again, the novice must not get alarmed at the word "filters." They are merely pieces of specially coloured glass, which are fixed or held in front of the

camera lens whilst the photograph is being taken. Their purpose is to prevent light of certain colours from acting on the film. They work equally well with cheap as with expensive cameras.

They are obtainable from any photographic dealer, and we should do well to buy two: one known as a "two times," and another known as a "four times," because they lengthen the exposure by those amounts.

The Cenotaph.

A Pylon.

subject under the particular lighting conditions prevailing. (The Wellcome exposure meter is a great help for this purpose.) By dividing this exposure approximately by 8 or 4 we obtain the correct exposure for the "two times" and "four times" filters, respectively, when photographing sky and clouds.

An example will make this clear. On an early November day, any time between 11 a.m. and 1 p.m., when the sun is shining brightly, the exposure for a normal subject, using Verichrome or SeloChrome film, is $1/25$ th at $f/11$. Using the "two times" filter we should give $1/200$ th at $f/11$, and with the "four times" $1/100$ th at that aperture for subjects similar to those illustrated on this page. The darker the filter, the darker is the blue sky rendered. Shortening the exposure produces the same effect.

It might assist to mention that the pylon subject was taken with a "two times" Agfa filter on Agfa Isochrom film; the telegraph pole with a "four times" filter on the same film. For the Cenotaph a "four times" filter was used with Kodak Super Sensitive Panchromatic cut film. Exposures were calculated exactly as indicated above, and this calculation will answer in most cases.

The News Carrier.

Now, armed with our filters, we want to take a photograph with clouds in it. What do we do? Well, if we want the best effect, we first wait for a day with plenty of white "cotton-woolly" clouds set in a clear blue sky. Then we get into a position with the sun behind or a little to one side of us. This is important. Next, we determine what would be the exposure for a "normal" landscape

*Introducing
the*

IKOFLEX

THE NEW

ZEISS IKON TWIN LENS REFLEX

This beautifully-made reflex camera showing a brilliant picture the right way up on its ground-glass screen will be wanted by every amateur who likes to see actually what he is taking before releasing the shutter.

The full-size finder hooded to avoid extraneous light; the two anastigmats of magnificent quality; the brilliant image obtained by aid of a magnifying condenser and giving perfect illumination, even in the corners of the field; the smooth focussing, the clever film-winding, and the pleasingly modern appearance place the Ikoflex in a class by itself.

AND WHAT ABOUT PRICE?

It may appear at first sight that such a high-class instrument, produced by the world's largest manufacturers of precision cameras, would necessitate a price outside the means of most amateur photographers. Such is not the case. For the first time a complete twin lens reflex camera fitted with the high-class

NOVAR ANASTIGMAT F/4.5 AND IKOFLEX SHUTTER

can be bought for **£7 : 10 : 0**

Later on an Ikoflex model with Novar f/6.3 will be available at **£6 : 10 : 0**

All high-class dealers should have stock of the Ikoflex, but if your dealer has not please write to us and we will make arrangements for you to see one in your neighbourhood.

Fully Illustrated Descriptive Folder Free on Application.

ZEISS IKON LTD.

LONDON, W.1

Rolleiflex

POINTS WORTH CONSIDERING

A single wind of the cranking handle and you're ready for the next shot. Any number of shots up to 12 (without reloading)—time 1½ seconds per shot.

The Zeiss Tessar lenses give perfect results all the year round, and perfect indoor snapshots: On 3¼×2¼ 8-exposure film gives 12 pictures for 1/-.

Shutter speed and stop readings are seen in the window above the finder lens and can be seen and controlled while you are composing and focussing your subject. One lever sets and exposes the Compur shutter. No need to take your finger off the trigger or your eye off the picture.

The focussing magnifier, with the picture right way up and actual size, permits instant and accurate focussing and composing. With Zeiss Tessar Lenses: F/4.5...£20:0:0 F/3.8...£22:10:0

The Rolleiflex book, price 6/-, contains a mine of information concerning Rolleiflex photography.

There is also "THE ROLLEICORD" built on similar lines to the Rolleiflex.

Ask your dealer to show it you. Price £10:10:0

CASH and the CAMERA

By "FREELANCE."

The photographer who wishes to make money from his hobby, or at least to make it self-supporting, will find some useful market tips in this feature.

LANDSCAPE, child, and animal photographs are sought, for postcard reproduction, by Wilson Bros., Ltd., 80, Great Eastern Street, London, E.C.4. Payment for accepted pictures is on acceptance.

Agricultural photographs are used as illustrations to a feature dealing with farming and allied subjects in the *Daily Mail*, and the market is worth bearing in mind.

A similar opening, for gardening photographs, exists in the *Daily Herald*. Good payment is made for suitable pictures of gardens. Photographs of small sections of gardens appear to be in greater demand than general views.

"Send us some of your snapshots," invites *Car Topics*, 418-422, Strand, London, W.C.2. The rate paid is 5s. per print, and overseas pictures as well as scenes in Great Britain are used. It is not essential that the subjects include a car.

Mr. W. X. Bethel, 166, West Van Buren, Chicago, Ill., U.S.A., states that he desires photographs of amusing epitaphs. Snapshotters capable of taking clear pictures are invited to write, "as you may live near an epitaph I want."

Good landscape pictures are used by *Windsor Magazine*, Warwick House, Salisbury Square, London, E.C.4.

With the approach of winter, shop window displays are assuming rather more importance, for artificial lighting lends itself to the creation of some novel effects. Photographs of such displays, if the subjects are original, are in demand among the trade periodicals dealing with the trade concerned.

If you have an acquaintance who has constructed something novel or intricate in the model line, a likely market for a photograph of the object is *Hobbies Weekly*, Dereham, Norfolk.

Weekly Illustrated, a photogravure periodical launched a short time ago, is using many photographs. All, however, must be striking. Series in particular are favourably considered. One such series depicted various phases in the day's work at a racehorse stable.

Pictorial Education, Montague House, Russell Square, London, S.W.1, is a magazine worth studying by photographers who can supply pictures of the "how it is done" type. Payment is good.

Another firm purchasing photographs for postcard reproduction is Valentine & Sons, Ltd., Dundee. They particularly require close-up child portraits. Cat and dog pictures are also in demand here.

Cycling, 5-15, Rosebery Avenue, London, E.C.1, has a "Tourists' Page," for which photographs are considered. Pictures of quaint rural customs that cyclists might ride to see are used, together with about 150 words of letterpress. Contributions of this type, showing annual customs, should be submitted well in advance of the date. Photographs of curiosities seen by tourists are used on the same page. A pair of pictures recently used, for instance, showed curious gates.

If you know a friend who is skilled at some unusual handicraft, and can obtain a photograph of some of the work produced, a likely market is *Modern Woman*, 8-11, Southampton Street, London, W.C.2. A short MS. describing the operations should accompany the photographs.

Our Own Magazine, 3-5, Wigmore Street, London, W.1, uses animal and child portraits.

Photographs of interest to readers in the Midlands are used by *Birmingham Weekly Post*, 6, Cannon Street, Birmingham. A half-page picture of a Midland beauty-spot is used frequently on the cover.

THE question of a satisfactory mountant for prints is always occurring to the amateur photographer, as frequently, in fact, as it does to the office worker who requires a good adhesive for various purposes. A new mountant called "Fixol," which has been put on the market by Fixol & Stickphast, Ltd., 27 and 47, Garden Row, London, S.E.1, seems to fulfil both conditions admirably. Primarily it is an extremely satisfactory mountant in that it is very adhesive indeed and is not too "wet." For this reason quite small touches of it applied to the corners of a photograph will hold even a fairly large print very firmly. It is sufficiently fluid, however, to brush evenly over a large surface without lumps or other troubles from foreign matter. These points are also in its favour for office use, and the new aluminium container is particularly worthy of note. This not only holds a considerable quantity of the paste, and is equipped with a very efficient brush fastened to the cover of the container, but the paste is kept always near the top by a patent rising base. This is pushed up from time to time as the upper part of the paste in the container is used. It is certainly one of the cleanest mountants in use that we have

seen. The large size container with brush top and rising base sells at 1s. 6d., and a smaller size in a different container with loose brush sells at 9d. It is obtainable from all photographic dealers and stationers, or direct from the above address.

A POCKET ciné projector that is really practical in use and will either project a small picture, or can be used as a viewing apparatus while a ciné film is in motion within the container is a definite attraction that will appeal to a great number of readers who use 9.5-mm. films. When, in addition, it is stated that this attractive article sells at only 25s., we believe that it will have very extensive sales during the Christmas period, and at all times as a useful piece of apparatus as well as an entertainment novelty. It is called the "Presenta" Pocket Ciné, and is so small and light that it can be held easily in one hand. When it is opened a charger of 9.5-mm. film is adjusted within and connected with a winder. The film can then be seen in motion by holding the apparatus to the light, looking through the sighting lens and winding the film. For use as a projector an ordinary miniature electric light bulb is fitted which works off an ordinary 4½-volt flashlamp battery. A brilliant image on a small scale is then projected but is sufficiently large to entertain a considerable number of people. The "Presenta" Pocket Ciné is self-contained and is always ready both for viewing, projection or for film editing. It is obtainable from many dealers or direct from Presenta, Ltd., 74, Chiswell Street, London, E.C.1.

November 7th, 1934

At a Herring

NOTES ON A TOPICAL SUBJECT.

fine picture and lends itself to pictorial treatment.

The herring markets, where the drifters discharge their catches, will tax your supply of sensitive material. A general view, showing the forest of masts and ropes, can be secured with $\frac{1}{50}$ th sec., but a faster shutter speed will be necessary for close-ups. If you decide to take a drifter's crew close up, discharging the silvery herring, at least $\frac{1}{100}$ th sec. will be required to arrest movement.

On the pickling plots you will find the Scotch fisher-ladies preparing

Herring Boats racing for the quays from the fishing-grounds, after being held up outside the harbour at Yarmouth owing to the glut.

THE herring season at Lowestoft and Yarmouth, which takes place annually about October and early November, gives the amateur photographer great scope for picture-making of an attractive action subject. This year there has been a glut of fish, and many trawlers have been idle for days at a time, but this cannot last and fine subjects are generally available if a good day is selected.

Armed with a plentiful supply of plates or films, one may have a real good time on the herring markets at either port. Subjects are plentiful and interesting, and with a little care and thought there is no reason why a good "bag" should not be secured. Any reliable snapshot camera can be used, and fast plates or films. During the mornings, when most of the work is done, the light is generally quite bright enough for rapid exposures.

At the harbour heads will be found the sturdy drifters ploughing their way to the harbour from the herring-grounds in the North Sea. On a rough day, you will probably be able to secure a shot of a drifter coming in with the decks awash, and the look-out man, clad in oilskins, standing at the bows of the vessel. This makes a

At the Herring Market. Salting and boxing the fish for export to Baltic ports.

Preparing herring for packing. A snapshot on the "Pickling Plots."

the herring for export to the Continent. Excellent action pictures are just waiting to be taken, but the photographer must not get in the way. They work in the open, and must be the hardest set of girls in the country. It is advisable to pick a bright morning, so that the fastest shutter speed may be employed. The speed at which these girls work is amazing, and nothing under $\frac{1}{200}$ th sec. should be used if you want good action photographs.

Port *with a* Camera

By "FLEETWING."

The girls work at long troughs filled with herring, and after a minute or two they will ignore the camera; then is your chance to get to work. Do not ask them to co-operate in getting a picture, they are far too busy, and, after all, an unposed photograph is far more attractive than a posed one.

Close-ups of the Scotch girls packing the prepared herrings into barrels

A busy scene at the quayside, Yarmouth. Packing the herring in baskets after being unloaded from the trawlers.

Cargo steamers loading barrels of herring for the Continent.

are easy to get, but the girls are never idle—even when they are waiting for the herring fleet to come into port you will find them busily engaged in knitting.

During the season, fresh herring as well as salted are

exported to the Continent from Lowestoft. Large cargo steamers leave Lowestoft daily for the Baltic ports. Permission to board one of these vessels is rarely refused, and by going up on to the bridge you will be able to get some shots looking down on to the decks and into the holds where the cases of fresh herring are being packed.

Although these notes are intended for "still" photographers, ciné operators will find much that applies to them. A complete record of the herring industry could be filmed, from the arrival of the drifters to the dispatch of the fish. A successful film depends upon action; the herring industry offers the ciné camera action in plenty, and scope to make a most interesting picture.

Typical Scotch fisher-lassies filling barrels with herrings.

Scotch Drifters in port at Great Yarmouth.

With the Beginners

Every week an article will appear under this heading dealing with a topic of interest to the novice in photography.

NOTES & NOTIONS
for the
LESS ADVANCED
WORKER

STANDARD PRINTS.

ALL of us, especially during the summer months, see large numbers of prints, mostly holiday snapshots, which our friends produce for our inspection. Out come the prints, from pockets, wallets and bags, at home, in vehicles, and even in the streets; and they are examined, discussed and explained (and incidentally pawed about) with much liveliness. This is very jolly (sometimes), and I have no stone to fling at the practice.

At the same time, I think a good deal of improvement is advisable and possible. The vast majority of the prints are of a standard, stereotyped character; highly glazed prints with white margins, sometimes with "deckled" edges, and often painfully hard and contrasty. Occasionally we find some of beautiful quality, on matt or semi-matt paper, with harmonious tone values. The general run, however, are of the kind that result from the stock question at the D. & P. counter—"Develop and one?"

This means that the spools of film will be developed automatically by standardised methods, and that

from the whole of each passable section a standard print will be made. In many cases the work is skilfully and judiciously done—as well as can be possible when customers demand that it shall be put through in so short a time that it cannot possibly be adequate for the best results.

The photographer who uses a camera only occasionally, and at long intervals, does well to have his negatives developed professionally, provided he resorts only to capable firms. On the whole the results will be much better than he could obtain himself. It is only the experienced worker who can make the adjustments of exposure and development that certain types of subject make necessary.

Fig. 2.

When it comes to printing, however, I think that the photographer should learn to do his own, and that as soon as possible he should organise enlarging arrangements. I know this is no light and easy matter, but if he is not sufficiently keen and energetic to tackle something of the kind, he must continue to content himself, as best he can, with the standard prints. Of course, he can get enlargements made for him, but there cannot be the same freedom and latitude as if he did them himself, and the expense becomes a matter for serious consideration.

I have just borrowed from friends the three film negatives, $3\frac{1}{4} \times 2\frac{1}{4}$, from which the illustrations are made, and I will say a word or two about each.

The negative from which Fig. 1 was made was one of several interesting records of skies and atmospheric effects at sea, and even as glossy contact prints they were pleasant to look at. The one I selected was rather unbalanced in its tones, and required a little simple dodging when making the enlargement. On whole-plate paper the original print is very attractive. It is in every way better than the little contact print. In my opinion, with all respect for the miniature print lovers, some subjects, from their very character, require to be shown

Fig. 1.

Fig. 3.

on a reasonably large scale. Other subjects are better kept small.

The size, grandeur and impressiveness of mountains and imposing architecture may be contained in tabloid form; but most of us have minds that can appreciate all these things better when they are amplified, so that we can take them in at a distance (as we see them in reality), instead of peering at them through a magnifying glass (which we do not do when viewing the subjects themselves). So I think that the subject shown in Fig. 1, and many others like it, are all the better for some degree of enlargement.

The simple "personal" subject of Fig. 2 was almost buried in its surroundings, and has been selected and

arranged by enlarging. This could be done professionally only if the owner of the film had made a mask to indicate just what part of the negative he wanted enlarged. Had my friend been in a position to do his own enlarging, he could have selected the required part as easily as I did myself.

Fig. 3 is even more drastically treated. When my friend showed me the contact print, I promptly took two other prints, back upwards, and masked off just the strip shown. He was amazed at the suggestion that all the rest should be sacrificed. Then I showed him, by different masking, what he was "sacrificing." First, there was a monotonous area of sky, without clouds or gradation of tone;

second, there was an equally monotonous strip of water below the reflections. Between them they swamped the strip of landscape which caught his eye on the Broads, and prompted him to make an exposure.

An alternative in this case, would be to mask out the sky, and print in some clouds; but this would have involved cloud reflections in the water, and the task would have been no easy one. So that the enlargement of the panoramic strip was the simplest and best solution.

These are all familiar and common examples and suggestions of what the amateur can do once he equips himself for using his own discretion, and departing from the "standard" print of commerce.

W. L. F. W.

Letters to the Editor

The Editor is not responsible for the opinions of his correspondents.

PRINT TRIMMING.

SIR,—Re the article on "Trimming" in "The A.P." for October 24th, a Valet knife can be purchased from Boot's and other chemists for 1s. This little instrument is of great use to any photographer. I have used mine to trim prints and also to cut up to 10-sheet board. With compliments.—Yours, etc.,

R. BATTLE.

ANASTIGMAT LENS.

SIR,—Here is a rather interesting point that I am sure many of your readers would like to have explained.

An anastigmat lens projects the image of an object at infinity on to a flat plane. Now when it is focussed for a flat object (say a wall) 6 ft. away from the camera, it is called upon to throw an image on to a flat plane of an object, some of which, the centre, is 6 ft. away, and some, the corners, is 7 ft. Surely it is unable to accomplish this.

Perhaps some of our lens manufacturers would be good enough to comment on the subject.—Yours, etc.,

B. C. HAMILTON.

MINIATURE CAMERA WORK.

SIR,—Replying to Mr. Burr's request for advice on the use of miniature cameras, I hope he will find the latter part of this letter helpful.

Although he does not state exactly what he means by "the

cheaper f/4.5 anastigmats," I am amazed that he cannot make successful enlargements of postcard size from V.P. negatives.

I am at present using an Ikonta 520 camera, fitted with a Novar f/3.5 anastigmat, giving negatives $2\frac{1}{2} \times 1\frac{3}{8}$ in. Panatomic film, developed with Johnson's fine-grain developer. Landscape negatives are enlarged to 12×8 in., a magnification of about 6 diameters. For portrait work, by artificial light at full aperture, I usually use the head and shoulders portion, measuring $1 \times \frac{3}{4}$ in. on the negative, and enlarge to whole-plate, a magnification of just over 8 diameters. In nearly all cases where a pictorial effect is desired I have to use some diffusing device on the enlarger, as otherwise the definition is too sharp. Most of my work is on Kodak Fine Grain Royal bromide paper, and I have yet to see any evidence of grain, when viewing the finished print at a normal distance.

When Mr. Burr says "up to date I have not tried fine-grain film," I think he supplies the explanation of his trouble. To attempt enlargements of the above magnifications from negatives on ordinary film is like examining a newspaper illustration through a powerful reading-glass, and stating that the pressman used a poor lens when making the original. It must be remembered that a magnification of "ten diameters" means that the area of the grains is multiplied by one hundred, and it is area that matters when it comes to visibility.

If Mr. Burr will try a fine-grain film, and develop it in a fine-grain developer, taking great care to maintain a fairly even temperature, and avoid mechanical damage to the wet film, I think he will have a pleasant surprise, and cease to blame his lens. Needless to say, I have no commercial interest in the apparatus and materials quoted, but believe in giving definite data from personal experience.—Yours, etc.,

C. W. MARTIN.

How I make my EXHIBITION PICTURES

No. CCLIV.

Mrs. F.
KINDER.

Methods and Ideals of well-known Pictorial Workers.

From information communicated to our Special Representative.

"I AM almost afraid to think how many years it is since I set up a quarter-plate camera and took my first photograph. My ambition soon soared to a half-plate, and eventually to a whole-plate, which, with much labour, I carried about on a bicycle, as landscape has always been my favourite subject.

"In my earlier days I aspired to be an artist, and to that end attended various art classes and studios, and painted in oils. When, however, I left the country and came to live in

London I gave up colours and devoted myself to photography. At any rate my art training came in useful in helping me with composition, tone values, and a knowledge of light and shade, which in photography are mainly what we rely on for getting our effects.

"Early in my photographic career I joined a Postal Club, and was much helped by the drastic (though sometimes encouraging) criticisms, to which I owe many thanks for guiding my footsteps in the right way.

"I ranged through all the printing processes in vogue, from P.O.P. to platinotype, gum-bichromate, carbon, carbro, and eventually bromoil. The last is still my favourite medium, though now it has rather fallen on evil times, and chlorobromide has taken its place.

"None the less, bromoil seems the ideal medium for picture-making, which is always my goal, as it gives plenty of scope for expressing individuality. I have no hesitation in saying that I use every art and means to attain my ends, and try to make my camera my servant and not my master.

"As regards my methods of working, I have for many years used panchromatic plates with a K 1 filter, and panchromatic films for my small camera. All my work is done with reflex cameras, and I use a quarter-plate and a Rolleiflex, which I find invaluable for moving objects. I always desensitise my plates and films, and then develop in a dish in a red light, so as to watch the development, and try to get the right density for whatever printing process I intend to use. I then take a print from my negative, and if necessary I retouch the negative and then make an enlargement of the size I intend to use. From this I study what wants lightening or darkening, and get my results by masking, by local development of the print and other methods, and also try various makes of papers. For bromide prints I use amidol, but for chlorobromide I use the maker's formula.

"The print 'Joy-Riders' was taken with my Rolleiflex camera, at 1/100th of a second on pan. film. It was no mere lucky snapshot, but the result of two years' study of swings and roundabouts whenever I could get near them. It required a good deal of patience just to hit on the right moment at the top of the swing, and then probably the sun went in, or the girl looked the wrong way, or the man in charge suddenly stopped the swing with a long pole.

"I have always been attracted by strong light-and-shade subjects, and the silhouette of the boat up in the air seemed to lend itself, with the lines of the ropes, to an effective picture. I must have taken a dozen negatives of these subjects, and found it quite amusing to watch the different expressions of the children's faces.

"But landscape is really my first and last love, and I fear the modern style of photography has no appeal to me. It seems such a pity that the wonderful technical skill of the modernists is not used for more artistic results. However, I live in hopes that when they have grown tired of piles of saucepans, rolls of cardboard, and harsh artificial lighting, they will turn again to the beauties of Nature—the wonders of sea, sky and mountain—and make pictures that will give real pleasure when we hang them on our walls."

MIGHT AND MAJESTY.

F. Kinder.

PICTURES of the WEEK

Some Critical Comments on the Beginners' prints reproduced on the opposite page.

"THE HARBOUR," by Clifford Woodward, No. 1 of the prints reproduced on the opposite page, is quite an excellent piece of work, not only from the technical standpoint, but also having regard to its acceptable form of composition and the appropriate selection of a foreground of more than ordinary length.

Looking Downwards.

Until the advent of photography, it was very rare to see any departure from the customary proportions of a picture by which one-third of the picture space was devoted to the landscape portion and two-thirds to the sky.

The facility with which a camera can be made to include the same proportion, or more or less, led to the adoption, in subjects where the main interest was shown in the foreground, of a viewpoint with a downward inclination, and, in such cases, it was found desirable to reverse the proportions in question and allot two-thirds, or thereabouts, to the landscape element. The lead, initiated by photography, has been followed by practitioners of all the graphic arts, and it is now no uncommon thing to see the painter choosing a viewpoint of some height and looking down upon his subject.

Nevertheless, it must be remembered that any departure from the normal point of view demands a justification, and it cannot be used without discrimination or consideration. A long foreground, in which there is no interest, is simply an eyesore; but, if it be suitably filled, and either contains or has elements which lead up to whatever happens to be the centre of interest, the reverse obtains.

In the print under discussion, the principal feature is the fishing-boat on the right. Its presence justifies the length of the foreground, for, were it shorter, there would not be sufficient room below the boat, and it could not sit comfortably in the picture space.

Picture Proportions.

Moreover, the reflections, which form an added attraction, would be curtailed, and the subject would seem restricted. As the arrangement now

stands, these drawbacks are avoided, and the choice of the long foreground is not only justified, but it also adds a certain novelty to the impression.

At the same time, it could be wished that the light and shade were enhanced by a pronounced effect of sunshine. It does seem to be present, but, as its influence is spread over the whole of the print, and there is not enough shadow to make it evident, it is too dispersed to be of any real value. It ought to be more localised or concentrated in one particular spot—preferably in the principal vessel.

In the case of No. 2, "Trout Enthusiasm," by E. H. Whitford, which is also characterised by a similar type of viewpoint, the sunlit figure of the fisherman provides that feeling of concentration that is needful. There is a certain amount of competition in the bright notes of the foliage above, but, if the subject can be visualised with this reduced to a lower value, it will be appreciated how great the gain would be and how much the impression of sunlight is stressed by localisation.

Concentration and Dispersal.

The light on the figure gains value because it is concentrated, and also, to a not inconsiderable extent, by the fact that there is a large proportion of shadow. In No. 1 the light is not conserved, and loses by dispersal.

Coming to No. 3, "Hampton Court," by J. A. Stirling, which is a more normal type of subject, and does not need any departure from the normal view level, there is a modification of the same principle of concentration. There is quite a sufficiency of shadow, but the lights in chief—the splashes of light on the left and on the steps—are divided into three. The fact that they are divided may entail some little loss in concentration, but, as they occur in a sequence, a connection between them is suggested, and, in effect, their attraction is united in the form of a group.

It may not have quite the same pull as if the light were absolutely a single unit, but the loss is scarcely noticeable, and for all practical purposes is negligible. In the case of No. 5, "An Italian Courtyard," by H. F. Hands, however, a suggestion

of disunity arises because of the existence of light notes on both right and left edges.

Division of Interest.

The space between them is too wide for any effective connection to be established, and, consequently, there is a division of interest.

Something might be done to improve matters by trimming a bit from the left so as to remove the light from that side, and the foreground shadow, which, in present circumstances, is helpful, would then function in seeming to hold the two sides together. If it were also found possible to include a small shadow on the extreme right to diminish the light at that edge and to join up with the shadow across the base, the feeling of concentration would be immeasurably advanced.

The value of a single dominant light in pulling a composition together is shown in No. 6, "The Old Schoolhouse," by Michael Wilkinson. That light is to be seen underneath the bridge, and, though there are light tones elsewhere, it remains the brightest and its attraction is paramount. It is much the same when the reverse obtains, as, for example, when dark is contrasted against light.

Extremes in Conjunction.

It is for this reason that the features stand out so well in No. 4, "Portrait of a Bedouin," by S. J. Vella. Here, the face is the only dark in a setting of light, and, in consequence, gains concentration and force. Extremes of tone in conjunction attract the attention by power of contrast, and, although the setting may appear somewhat restricted in this particular instance, the defect should be corrected, on another occasion, by the adoption of a more distant viewpoint.

The placing of light against dark is the reason why the chief figure stands out well in No. 8, "Homeward Bound," by R. H. Locke, but the printing has been carried a stage or so too far and appears degraded in consequence. No. 7, "Buttermere," by Miss B. C. Crichton, is much better, judged in this respect, but it could be wished that the tree on the left were not quite so much an intrusion.

"MENTOR."

Pictorial Analysis

Every week one of the pictures reproduced on an art page will be analysed in detail for the benefit of readers of the paper who are seeking to improve their pictorial work.

"PATTERN IN THE SKY," by Will Till.

IN these days of vastly improved emulsions, with their greatly increased range of colour sensitivity, it is perhaps no uncommon thing to find a full rendering of the tones of a sky, together with all the subtleties of gradation which distinguish the cloud forms, and, at the same time, a landscape which betrays no lack of modulation or any sign of under-exposure.

The Sky in Landscape.

Only a few years ago, such a thing would have been a practical impossibility, for only in exceptional circumstances could a fully-exposed landscape be obtained without so over-exposing the sky that its gradation, even if recorded, would be unprintable.

Either the sky would be recorded and the landscape lacking through under-exposure, or, if the landscape were properly rendered, the sky would be represented by utter blankness. The advent of colour-sensitive plates and films (panchromatic) and light filters has effected a radical alteration, and, in any ordinary combination of landscape and sky, little difficulty is now experienced in retaining the full values of both.

It is undoubted that the fact is responsible for the production of this picture. Its truth of tone, both in landscape and sky, has been rendered possible by the advances in question, but, at the same time, it is so rarely that a cloud of so exquisite a form is seen—and, if seen, caught—that the picture attains a most unusual and remarkable appeal. It is decidedly attractive, and at the recent exhibition of the London Salon of Photography occasioned a considerable amount of favourable comment.

It represents an achievement of which its author may well be proud. The sky is magnificent, and the landscape retains just sufficient interest, with its hint of sunshine and depth of

tone at the base, to carry the greater attraction above.

Compositional Form.

It will be observed that the shape of the cloud is roughly that of a triangle or pyramid. It has prominences which extend beyond the

The feeling of strength is attributable to the nature of a pyramid. A triangular object sits firmly on its base and is not easy to upset. The tremendous impression of static power which the Egyptian pyramids convey, in actual fact, arises from the same cause, and, similarly, when the shape occurs in a picture, even if it be somewhat disguised or be not wholly complete, a like feeling of strength is created. Hence the vital suggestion of vitality and power that is imparted in this case.

With the main attraction in the sky, it would scarcely be fitting for the landscape to be endowed with any great measure of attraction. It should be sufficiently interesting to maintain the sky, but not enough to create any sense of competition.

Here, the relative attractions are adjusted to a nicety. The landscape portion is just about one-fifth of the total area of the picture. The limitation prevents it from becoming too assertive, and the attention excited by the effect of sunshine is adequate to relieve it from monotony without exciting too much interest. The presence of the horse (2) provides an accent that balances the spot (1) where the brightest light appears.

A further feature which indicates a nice idea of balance is afforded by the dark strip along the base. It may seem to conflict a little with realism and owe something

to after-treatment, but it gives that weight of tone at the bottom of the picture that not only suggests stability but initiates a balance between depth of tone in the lower portion and the greater area devoted to the sky.

Space is countered by weight of tone, and, in other respects, the print is equally well contrived. There is, for example, a very real sense of a recession of planes in the cloud form, and aerial perspective is by no means easy to suggest in circumstances such as these.

"MENTOR."

precise geometrical form, and depressions which fall inside it, but its main mass is one that approximates to the shape in question. Nor would it be wise to adopt a formation approaching the form more closely, for it would then become obvious, and the obvious is a thing to be avoided in the arrangement of a composition.

It is, however, near enough to keep all the strength of such a formation, as may be seen on reference to the accompanying sketch, where it is indicated by dotted lines.

Amateur Cinematography

Topical Ciné Work By M. A. LOVELL-BURGESS.

IT'S good to have a ciné camera when the road to everywhere is turning white and hard in March. It's fun to be out "on location" in mid-summer. But autumn and winter are equally rich in opportunities and experiences for the ciné enthusiast. There's the sound of voices and laughter once again in the studio. There are films to be edited, titling to be done, and—arising from a recognition of the fact that the proof of the pudding is not only in the eating, but also, so to speak, in the dishing-up and serving—decisions have to be made on all that concerns successful presentation: a good screen, artistic lighting, a well-balanced programme, music, or a running commentary.

But what about actual winter cinematography?

There is always a certain amount of sunshine even in winter, and on such days ordinary panchromatic film is sufficient. On dull days a super-sensitive pan. will compensate for the lower intensity of the light. Sea pictures, a sense of form expressed, maybe, in gaunt trees, picked out like sentinels or massed like mountain ramparts against the west, silhouettes, mist effects, movement, snow, and the occasional use of the colour wheel, can all find pleasing place in winter films.

The new, faster films have made indoor winter evening work a simple matter with the aid of one, two or more of the many inexpensive flood-lighting lamps on the market. And these lamps, despite their "high pressure," are not expensive to run unless you are unreasonably lengthy in filming. If you buy a reflector—or, equally well, make one—you can economise on the number of lamps required.

If you intend to give a special Christmas show of your films—and I hope, incidentally, London amateurs will do their best to capture some of the pageantry of the Royal wedding, which would make a particularly acceptable film for a festive gathering—you will probably want one or two supporting films from the libraries.

If this is the case, remember to order early and to give at least three alternatives.

News from the Clubs.

The first number of the overdue quarterly bulletin of the Independent Film Makers is "out" at last, and I am indebted to Mr. E. Lightfoot for a copy of it. It is edited by Leslie Beisiegel, whose first concern is to assure readers that I.F.M.A. is concerned only with those film-makers interested in the film of reality—documentary. "For those more interested in their ego we advise searching elsewhere for encouragement," says Leslie Beisiegel, scathingly.

And here are two S.O.S.'s before the news.

Will any member who has had experience of sound-on-disc recording and reproduction, and who knows the advantages and disadvantages of

various systems of disc recording, write what he knows about it to 32, Shaftesbury Avenue, London, W.1. The sound is to be used in conjunction with 16-mm. projector, and is to be recorded after the film is made.

The second experiment, to which the bulletin draws attention, is an attempt by a member to discover the truth of the theory that the eye follows the line of a picture and is led to a certain point. The member wants to test this theory by a slow-motion close-up of an eye suddenly confronted by a picture of the required type. If any members possessing facilities for slow-motion are interested in making an experiment they can get in touch with the member concerned through the Shaftesbury Avenue address already given.

Eastbourne ciné amateurs met in the Oak Cabin Restaurant on Friday evening to consider titling in all its

Members of the Croydon Amateur Film Club shooting a scene from "So this is Success," a film they are now making in their own studio at 1, South Park Hill Road, Croydon. New members will be welcome to the club.

aspects. The full title of the club is the Eastbourne Amateur Ciné Enthusiasts' Club, under the presidency of Dr. J. Bodkin Adams, and its excellent Hon. Secretary is Mr. G. E. Inskip.

Mr. A. S. Chard, of "Cinécraft," London, made a special journey from the north of England to give a talk on titling, and to demonstrate title sets, in connection with which a competition is being run.

Mr. Peter le Neve Foster, President of the Manchester Film Society, made the only complete account of the King's visit to Manchester, and this is being shown all over the country. Mr. le Neve Foster also made a film of the recent I.F.M.A. Summer School, which includes shots of interiors and exteriors at Digswell Park; also of directors.

Mayross Motion Picture Productions have six super productions and a number of shorts, both silent and sound, scheduled for production. Club

meetings are held every Thursday at 8.15 p.m. at 68, Shaftesbury Road, Ravenscourt Park, W.6, and application for membership should be made to Miss E. Ingram—one of the few women secretaries of ciné clubs—at 20, Perham Road, West Kensington, W.14.

International Hobby.

I hope those of you who are interested in the making of interest, travel and religious films will see, if you are given the opportunity, "Beginning at Jerusalem," the missionary film sponsored by seven leading missionary societies. It differs from a travel film in that the selection of shots has been made with a religious, and not merely a "travel" object. There is nothing "goody-goody" about this film. It tells the only story in the world that has no ending—a story that is being worked out to-day, east and west, north and south, in terms of men and women, of love and heroic enterprise.

I should like to see "Beginning at Jerusalem" reduced to sub-standard stock. Perhaps if some representation to this effect were made to the Missionary Film Committee concerned this would be done. I am sure there would be a steady and continuous demand for this film by ciné amateurs.

Such films bring home to one very clearly the possibilities of cinema—possibilities long ago realised by the Communists, who even at this minute are setting up a sub-standard, non-flam, and consequently uncensored, circuit in this country. Films, like music, are international. A Chinese, a Japanese, an Indian, a German, an Italian and an Englishman could sit in a row, each knowing only their own language, and see "Beginning at Jerusalem" with more or less complete comprehension.

If you are internationally minded, accent your hobby in this direction this winter.

NEWS AND REVIEWS

ITEMS OF GENERAL INTEREST FROM ALL QUARTERS.

Every reader of "The A.P." who resides in the neighbourhood of Croydon, and is interested in amateur cinematography, should get in touch with the Secretary of the Croydon Amateur Film Club. His name and address is D. Rapkin, 10, Fairdene Road, Coulsdon, Surrey. The Club will be glad to hear from all who are keen on the photographic side of cinematography or anything allied to it. They have a good size studio and a clubroom attached, and are well equipped for artificial lighting. They have recently built a new room adjoining the existing studio in order that lectures, etc., may be given without disturbing the making of any film. Meetings are held every Thursday at 1, South Park Hill Road, Croydon. A photograph taken in the studio during the making of a film is reproduced on the preceding page.

The officers and council of the Western Counties Photographic Federation, which is in Alliance with the Royal Photographic Society, have written us to state that the Western International Photographic Salon, which has been announced to be held in Bristol in December, has no connection with the Federation. The only official exhibition of the Federation is held about June of each year under the title of the Western Salon of Photography, and the Hon. Secretary is F. E. Haynes, of 50a, Belvoir Road, St. Andrew's Park, Bristol, 6. The Hon. Secretary of the Western International Salon is W. H. Hill-Muchamore, 24, Church Road, Redfield, Bristol, 5.

An outline of the stories of the films in the Ensign 16-mm. library has just been published in the form of an attractive book of 128 pages under the title of "Pleasure Hours," by Ensign. The book is primarily a catalogue of all the films available for hire from the Ensign Film Library, but in every case a synopsis of the story embodied in the film is given. In this way the hirer of any film is able to judge in advance whether the subject is a suitable one, which he might not be able to guess from the title alone. It is a book that every owner of a ciné projector should get, particularly at the present time of year when he wishes to hire films for the winter season. The book costs 1s., and is obtainable from the Ensign Film Library, 88-89, High Holborn, London, W.C.1.

A new introduction by Zeiss Ikon, Ltd., is announced in the shape of the Ikonflex, which is the name given to the new Zeiss Ikon twin-lens roll-film focusing reflex. This little camera has an all-metal leather-covered body and, with a rapid-changing device, is for twelve pictures $2\frac{1}{2} \times 2\frac{1}{4}$ on standard $3\frac{1}{2} \times 2\frac{1}{4}$ roll film. It is fitted with the Novar anastigmat f/4.5 lens and Ikonflex shutter, giving 1/25th, 1/50th, and 1/100th sec., T. and B. It will sell at the low price of £7 10s., and another model with an anastigmat of smaller aperture will shortly be available at £6 10s. Particulars may be had free on application to Messrs. Zeiss Ikon, Ltd., 11, Mortimer House, 37-41, Mortimer Street, W.1. We hope to review this camera more fully in a later issue.

The Photographic Competition organised by the Polytechnic Touring Association for photographs during the Polytechnic Tours of 1934 brought a very large entry. The prints were judged by the Editor of *The Amateur Photographer*, and the prizes were awarded to the following: First, R. C. E. Harman, Wimbeldon Park; Second, Edgar Rawnsley, Menston-in-Wharfedale; Third, E. Norman Brothers, London, S.W.20; Fourth, S. A. Gandy, Chiswick; and Fifth, S. W. Heyburn, Hastings.

The Leytonstone and Wanstead Camera Club have just taken up their headquarters at the new branch library which has been opened in Leytonstone. They will have the use of the main hall, seating about 200 people, a large lantern screen and a closed-in projection room, while the walls are fitted with cork so that pictures can be pinned up without any trouble. As a result of this, the Club hopes to increase its membership. Full details will be sent on application to the Hon. Secretary, Mr. G. W. L. Carter, of 9, East India Dock, E.14.

The Battersea Institute Camera Club report a good year's work at their annual general meeting, and an attractive programme for the ensuing season has been arranged. A new and improved dark-room for the use of members is nearly completed. The subscription is small, and all interested are invited to join. Full particulars are available from the Hon. Secretary, Mr. W. Steele, 25, Grayshot Road, Battersea, S.W.11.

Re the Annual Supper Dance arranged by the staff of Wallace Heaton Ltd., and associated companies, to be held on November 24th, we have been informed by the organiser, Mr. G. A. Nott, that there are no further tickets available.

LATEST INTRODUCTIONS ALWAYS AVAILABLE AT THE "WESTMINSTER" LONDON'S MOST POPULAR DEALERS.

THE ENSIGN MIDGET MAGNAPRINT ENLARGER

F/6.3 Ensar enlarging lens, specially designed condenser, for enlargements up to 15 x 12 inches, chart giving various sizes. Will also take half-V.P.K., Leica or other small negatives. Complete with electric fitting. Less lamp.

£4:10:0

LEICA MODEL III

With F/2 Summar in Collapsible Mount.

Self-capping focal-plane shutter, speeds 1 to 1/500th sec., T. and B., automatic focussing, interchangeable lens mount, chromium plated. **£35:5:0**
Nine monthly payments of 82/3.
Fitted with f/3.5 Elmar anastigmat **£27:0:0**
Nine monthly payments of 63/-.

The Multi-Speed EXAKTA

Self-capping focal-plane shutter, speeds 1/10th to 1/1,000th sec., T. and B., delayed-action 1/10th to 6 sec.

Fitted f/2.8 Zeiss Tessar anastigmat, metal focussing hood, with magnifier, simple focussing, 3 ft. to infinity. Takes standard V.P. film. Double exposures an impossibility. **£26:0:0**
Nine monthly payments of 60/8.

PATHÉSCOPE 200-B PROJECTOR

9.5-mm.

OUTSTANDING FEATURES:

Fitted with highly efficient 250-watt direct lighting system, giving a brilliant screen picture 10 ft. wide. Flickerless projection. Very compact. Fan-cooled and asbestos-lined lamphouse. Simple threading. Universal tilting movement. Motor rewind for use on A.C. or D.C. supply, complete with lamp and motor drive for use on any voltage from 200 to 250 volts, 300-ft. empty reel and flex. Please state voltage when ordering. **£15:0:0**
Nine monthly payments of 35/-.

SECOND-HAND OUTFITS at

(FULLY GUARANTEED).

CAMERA HOUSE, 62, PICCADILLY, W.1

- 3 1/4 cm. Baby Ikona, f/4.5 Zeiss Tessar anastigmat, Compur shutter, speeds 1 to 1/300th sec., T. and B. **£7 12 6**
3 1/4 cm. Zeiss Ikon Kolibri, f/3.5 Zeiss Tessar anastigmat, Compur shutter, speeds 1 to 1/300th sec., T. and B. **£8 5 0**
3 1/4 cm. Zeiss Ikon Baby Ikona, f/4.5 Novar anastigmat, speeded shutter, 1/25th, 1/50th, 1/75th sec., T. and B. **£3 5 0**
3 1/4 cm. Zeiss Ikon Baby Ikona, f/6.3 Novar anastigmat, speeded shutter, 1/25th, 1/50th, 1/75th sec., T. and B. **£2 11 6**
Vest Pocket Volland, f/4.5 Radionar anastigmat, delayed-action Pronto shutter, speeds 1/25th, 1/100th, sec., T. and B. **£4 5 0**
3 1/4 cm. Fotet, f/4.5 Vidar anastigmat, Vario 3-speed shutter, 1/25th, 1/50th, 1/100th sec., T. and B. **£22 15 0**
Vest Pocket Tenax, f/4.5 Dornar anastigmat, Compur shutter, speeds 1 to 1/300th sec., T. and B. **£3 17 6**
3 1/4 cm. Rolloroy, f/3.5 Elmar anastigmat, Compur shutter, speeds 1 to 1/300th sec., T. and B. **£9 5 0**
Leitz Leica Model II, f/3.5 Elmar anastigmat, self-capping focal-plane shutter, speeds 1 to 1/500th sec., Bulb. **£19 17 6**
Leitz Leica Model II, f/2.5 Hektor anastigmat, self-capping focal-plane shutter, speeds 1 to 1/500th sec., Bulb, complete in ever-ready case **£20 15 0**
Leitz Leica Model III, f/2 Summar, collapsible mount, self-capping focal-plane shutter, speeds 1 to 1/500th sec., T. and B. **£27 10 0**
Leitz Leica (original model), f/3.5 Elmar anastigmat, self-capping focal-plane shutter, speeds 1 to 1/500th sec. and Time **£7 17 6**
10.5-cm. f/6.3 Elmar Long-focus Lens, coupled for Leica. **£7 10 0**
13.5-cm. f/4.5 Elmar Long-focus Lens, for Leica, not coupled. **£13 15 0**
Zeiss Ikon Contax, f/2.8 Zeiss Tessar anastigmat, self-capping focal-plane shutter, speeds 1/25th to 1/1,000th sec., Bulb, complete in ever-ready case. **£18 10 0**
Exakta, f/2.8 Zeiss Tessar anastigmat, self-capping focal-plane shutter, speeds 1/25th to 1/1,000th sec., T. and B. **£16 10 0**
2 1/2 x 2 1/2 Rollei-flex, f/3.8 Zeiss Tessar anastigmat, Compur shutter, speeds 1 to 1/300th sec., T. and B. **£12 17 6**
3 1/4 cm. Foth-Derby, f/2.5 Foth anastigmat, self-capping focal-plane shutter, speeds 1/25th to 1/500th sec. and Bulb, fitted with delayed action **£5 18 6**
3 1/2 x 2 1/2 Cocarette, f/6.3 Novar anastigmat, Dervall shutter, speeds 1/25th, 1/50th, 1/100th sec., T. and B. **£2 10 0**
3 1/2 x 2 1/2 Voigtlander Roll Film, f/4.5 Heliar anastigmat, Compur shutter, speeds 1 to 1/250th sec., T. and B. **£8 7 6**
3 1/2 x 2 1/2 Cocarette, f/4.5 Zeiss Tessar anastigmat, delayed-action Compur shutter, speeds 1 to 1/250th sec., T. and B. **£7 17 6**
Super Ikona, for 8 pictures 3 1/2 x 2 1/2 or 16 2 1/2 x 1 1/4 f/4.5 Zeiss Tessar anastigmat, delayed-action Compur shutter, speeds 1 to 1/250th sec., T. and B., self-erecting front, built-in range-finder. **£14 0 0**
Six-20 Kodak Junior, Doublet, three-speed shutter, 1/25th, 1/50th, 1/100th sec., T. and B. **£1 8 6**
Six-20 Kodak, f/6.3 anastigmat, 3-speed shutter, 1/25th, 1/50th, 1/100th sec., T. and B. **£2 17 6**
3 1/2 x 2 1/2 No. 7 Ensign Carbine, f/4.5 Ensar anastigmat, Mulchro shutter, speeds 1 to 1/100th sec., T. and B. **£3 19 6**
3 1/2 x 2 1/2 Ensign Selfix, f/4.5 Ensar anastigmat, 3-speed shutter, 1/25th, 1/50th, 1/100th sec., T. and B. **£2 12 6**
- 3 1/2 x 2 1/2 Voigtlander Inos, f/4.5 Skopar anastigmat, delayed-action Compur shutter, speeds 1 to 1/250th sec., T. and B. **£5 17 6**
3 1/2 x 2 1/2 Pentac, f/2.9 Dallmeyer anastigmat, Compur shutter, speeds 1 to 1/300th sec., T. and B. **£5 12 6**
4 1/2 x 3 1/2 Ica Halloh, f/4.5 Zeiss Tessar anastigmat, Compur shutter, speeds 1 to 1/250th sec., T. and B., panel for plates **£4 15 0**
4 1/2 x 3 1/2 A. & N. Auxiliary Roll Film, f/4.5 Cooke Aviar anastigmat, Compur shutter, speeds 1 to 1/200th sec., T. and B., double extension, panel for plates. **£3 17 6**
4 1/2 x 2 1/2 Kodak, Series III f/6.3 Kodak anastigmat, Diomatic shutter, 1/10th to 1/250th, 1/50th, 1/100th sec., T. and B. **£3 17 6**
4 1/2 x 2 1/2 Ensign Carbine (Tropical), f/4.5 Zeiss Tessar anastigmat, Compur shutter, speeds 1 to 1/250th sec., T. and B. **£6 17 6**
3 1/2 x 2 1/2 Ica Ideal, f/4.5 Zeiss Tessar anastigmat, delayed-action Compur shutter, speeds 1 to 1/250th sec., T. and B., 3 single metal slides and F.P. adapter. **£10 15 0**
3 1/2 x 2 1/2 Zeiss Ikon Trona, f/3.5 Zeiss Tessar anastigmat, delayed-action Compur shutter, speeds 1 to 1/250th sec., T. and B., complete with 4 single metal slides, roller-holder and leather case. **£13 15 0**
3 1/2 x 2 1/2 Etui, f/4.5 Zeiss Tessar anastigmat, delayed-action Compur shutter, speeds 1 to 1/250th sec., T. and B., double extension, complete with 3 single metal slides and F.P. adapter. **£8 17 6**
3 1/2 x 2 1/2 Trona, f/4.5 Zeiss Tessar anastigmat, Compur shutter, speeds 1 to 1/250th sec., T. and B., double extension, complete with 6 single metal slides and F.P. adapter. **£6 15 0**

Scottish National Salon (Art Galleries, Ayr).—Entries (Overseas, March 9; Great Britain, March 23). Open, April 20–May 4. Secretary, Arthur J. Nelson, 6, Hilary Crescent, Ayr, Scotland.

Brussels International Salon.—Entries, March 15. Open, May 7–June 9. Secretary, M. Maurice Broquet, Rue du Sceptre, 77, Brussels, Belgium.

Readers' Questions ANSWERED

GENERAL.—All communications for the Editor should be addressed to: "The Editor, *The Amateur Photographer and Cinematographer*, Dorset House, Stamford Street, London, S.E.1," and in every case, without exception, must give the name and address of the writer.

CONTRIBUTIONS.—The Editor is glad to consider original, up-to-date manuscripts on photographic subjects. All contributions must be typewritten, or in very legible handwriting on one side of the paper only. Letters or communications arising out of matters already appearing in the paper are not paid for. The Editor disclaims legal responsibility for the safety of matter submitted to him, but he will endeavour to return rejected manuscripts, etc., when a stamped addressed envelope is enclosed. MSS. or prints that are not actually accompanied by a stamped wrapper or envelope can in no case be returned. Reproduction fees for prints are only paid by arrangement beforehand. The sending of a print, without any condition stated, will be taken as permission to reproduce it without fee.

ENQUIRIES AND CRITICISM.—Advice, Criticism and Information are freely given, but the following conditions should be read carefully before applying, as any communication which does not comply with the rules must be ignored.

(1) See "General" above. (2) Every question and every print for criticism must be sent separately through the post, and must be accompanied by a separate stamped addressed envelope. No exception can be made in any case to this rule, except so far as enquiries or prints from Overseas are concerned. (3) Neither enquiries nor prints for criticism must be enclosed with competition prints. (4) On the back of each print sent for criticism, in addition to the name and address of the sender, must be the title (if any), and the criticism coupon from the current issue. (5) Enquiries should be clearly written, on one side of the paper only, and should be specific and not general. Such enquiries as "How can I take interiors?" or "Can you give me some hints on outdoor portraiture?" are too general to be dealt with in this section. (6) All envelopes should be distinctly marked "Query" or "Criticism," as the case may be. (7) Prints are sent for advice or criticism on the distinct understanding that by so doing permission is given for their reproduction without fee. We endeavour to deal promptly with enquiries, but cannot undertake to answer by return of post, nor can we give precedence to any enquiry.

A selection of those replies is printed each week, but all questions are answered by post. Enquiries from abroad must contain a coupon also, but it need not be from the current number, and should be cut from the latest issue to reach the enquirer.

Choice of Lens.

I have a 10x8 camera. Will you advise me what kind of lens I shall have to get to cover a plate of this size? G. T. (Woking.)

There are lenses of all types and prices that will cover a 10x8 plate. If you obtain lists from one or two makers you will find such lenses specified. It is generally stated what size plate each lens is intended to cover, with both a large and a small stop. A good deal depends on the kind of work you propose to do with the camera.

Pyro for Gaslight Paper.

Will you forward me a pyro-soda developer for gaslight papers? A. J. H. (Old Hill.)

We do not know of any pyro-soda formula that we should feel justified in recommending for gaslight papers. You cannot do better than use for any particular paper one of the formulæ given by its makers; otherwise you will certainly not get the best results.

Thin Negatives.

Are the enclosed negatives under-exposed or under-developed? If the latter, what is a safe intensifier? C. L. H. (Melksham.)

The negatives you send are not under-exposed but seriously under-developed. We should advise the use of a chromium intensifier, the method of using which we have frequently described, and quite recently in one of our beginners' articles. We doubt, however, whether you will be able to get sufficient density for using the negatives with normal papers, and you will probably have to use a vigorous type, even after intensification.

Speed Numbers.

Is there a ready method of converting H. & D. speed numbers into Scheiner numbers? G. S. B. (Ayr.)

We have repeatedly pointed out that there is no reliable and consistent method of translating H. & D. speeds into Scheiner speeds; the methods are fundamentally different.

Transferotype.

How does one use Transferotype paper for transferring prints to glass, wood, etc.? N. G. P. (Ely.)

Transferotype paper is made by Messrs. Kodak, Ltd., of Kingsway, London, W.C.2, and if you get some you will find that it is accompanied by full instructions as to the method of using it.

Bubbles on Plates.

I use air-free water when developing plates, but get pinholes due to bubbles. How can I get perfect negatives? Is it permissible to wipe over the surface of the plate with cotton-wool? W. L. H. (Letchworth.)

It is difficult to say why some people get defects which never seem to trouble others. There is no objection to passing a plug of cotton-wool gently and quickly over the surface of the plate. Another plan is to lift the plate out of the developer directly the latter is applied, as any bubbles that may have formed on the surface will then almost certainly break. Perhaps what you describe as "pinholes" are not due to air-bubbles at all, but to dust on the plate at the time of exposure.

Stained Negatives.

I send some sample film negatives made in India years ago. You will see that the surface on both sides is stained. Is there any way of removing the marks? C. A. T. R. (London.)

You will probably have no difficulty in cleaning up your negatives if you rub the surface with a plug of cotton-wool and a little Baskett's Reducer. We have frequently pointed out that this is a good method of cleaning away such stains, which are on the surface only.

London Societies.

Will you recommend one or two London photographic societies? I notice the names of the Camera Club and others, but have no addresses. Can you give them? M. L. R. (London, N.E.)

We are afraid it is impossible to give you a full list of all the photographic societies in London, and must refer you to "Photograms of the Year." We can, however, supply readers with the addresses of societies in their own particular district, and we mention the following for your own guidance: The North London Camera Club, Secretary, L. G. Gregory, 21, Dawlish Avenue, Powys Lane, N.13; North Middlesex Photographic Society, Secretary, Miss M. E. Blake, 112, Crouch Hill, N.8; Finchley and District Photographic Society, Secretary, Harry W. Wheeler, Westholme, 18, Elmhurst Avenue, East Finchley, N.2; Wood Green Photographic Society, Secretary, J. H. Dundas, 83, Philip Lane, N.15; Stoke Newington Camera Club, Secretary, A. Miles, 16, Chesholm Road, N.16. The address of the Camera Club is 17, John Street, Adelphi, W.C.2, and the Secretary is Mr. H. C. Giles; The Royal Photographic Society, 35, Russell Square, W.C.1, Secretary, H. H. Blacklock; The Secretary of the City of London and Cripplegate Photographic Society is Mr. W. E. Ginger, of 131, Hampstead Way, Golders Green, N.W.11.

Stop for Poor Light.

In the poor light of autumn and winter is an aperture of f/6.3 large enough to allow snapshots to be taken? M. W. (Liverpool.)

f/6.3 is quite large enough an aperture for taking snapshots even in the winter under reasonably favourable conditions; it depends largely upon the light and the subject. If you use an exposure meter this will tell you whether a given exposure at that aperture will be sufficient or not.

Safety Shutter.

Can the safety shutter of a single plate-holder be fully withdrawn, or only enough to expose the plate? A. A. (Lyminster.)

Assuming that the slides are properly light-trapped you may safely draw the shutter right out. The only point to remember is that in replacing it you must not insert one corner first, but put it square into the slot and push it right home.

Fogged Negatives.

Can you tell me what has caused the patch of fog on each of the negatives herewith? I have discovered a small pinhole in the bellows, but do not think this would account for the trouble. L. G. (Erdington.)

The fact that you have got a hole in the bellows sufficiently accounts for the fogging of your negatives, and the obvious thing to do is to get the defect remedied.

Shutter for Camera.

I have acquired a stand camera with two lenses but no shutter. Can you suggest a shutter that would be suitable for both lenses? E. J. S. (Wallasey.)

It is a practical certainty that you could have fitted to the front of your camera a Thornton-Pickard roller-blind shutter. This has a removable front panel, so that to take the two lenses you would require two panels, each fitted with a flange to take one of the lenses.

The AMATEUR'S EMPORIUM

Business Notices

Publishing

OFFICES.—Dorset House, Stamford Street, London, S.E.1. Telegrams: "Amaphot, Watloo, London." Telephone: Hop 3333 (50 lines).
PUBLISHING DATE.—"The Amateur Photographer and Cinematographer" is on sale throughout the United Kingdom every Wednesday morning.
SUBSCRIPTION RATES.—British Isles 17/4 per annum, Canada 17/4, other countries abroad 19/6 per annum, post free.
REMITTANCES.—Cheques, etc., should be crossed and made payable to Iliffe and Sons Ltd.

Displayed Advertisements

Communications on Advertisement matters should be addressed: The Advertisement Manager, "The Amateur Photographer and Cinematographer," Dorset House, Stamford Street, London, S.E.1. Copy for displayed advertisements for the issue of any particular week must reach Dorset House by the first post on Tuesday morning in the week previous. Rates and conditions will be sent upon application.

Prepaid Advertisements

SALE AND EXCHANGE: AMATEURS ONLY.—
 12 words or less 1/-
 1d. for every additional word.
PROFESSIONAL AND TRADE:—
 12 words or less 2/6
 2d. for every additional word.

Each paragraph is charged separately.
SERIES DISCOUNTS are allowed to Trade Advertisers as follows on orders for consecutive insertions, provided a contract is placed in advance, and in the absence of fresh instructions the entire "copy" is repeated from the previous issue: 13 consecutive insertions, 5%; 28 consecutive, 10%; 52 consecutive, 15%.
 All advertisements inserted in these columns must be strictly prepaid and posted to arrive at the Head Office, Dorset House, Stamford Street, S.E.1, not later than first post FRIDAY for the following week's issue, or one day earlier at the Branch Offices, 19, Hertford Street, Coventry; Guildhall Buildings, Navigation Street, Birmingham, 2; 260, Deansgate, Manchester, 2; 28a, Renfield Street, Glasgow, C.2.
 Advertisements are inserted, as far as possible, in the order received, and those received too late for one issue, or crowded out, are published in the first following in which there is space. The Proprietors retain the right to refuse or withdraw advertisements at their discretion.

Postal Orders sent in payment for Advertisements should be made payable to ILIFFE AND SONS LTD., and crossed

Notes being untraceable if lost in transit should not be sent as remittances.

& Co.

The Proprietors are not responsible for clerical or printer's errors, although every care is taken to avoid mistakes.

BOX NUMBERS.—For the convenience of advertisers, letters may be addressed to numbers at the office of this paper. When this is desired, the sum of 8d. to defray the cost of registration and to cover postage on replies must be added to the advertisement charges, which must include the words "Box 000, c/o 'The Amateur Photographer'." Replies should be addressed: "Box 000, c/o 'The Amateur Photographer,' Dorset House, Stamford Street, London, S.E.1," and these letters will be simply forwarded by us to the advertiser. It must be understood that we do not deal with the correspondence in any other way, nor accept any responsibility in connection with the advertisement. Readers who reply to Box No. advertisements are warned against sending remittances through the post except in registered envelopes. In all such cases the use of the "Deposit System" is recommended.

Special Note

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post. When sending remittances direct to an advertiser, stamp for return should also be included for use in the event of the application proving unsuccessful.

Deposit System

Readers who hesitate to send money to advertisers in these columns may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Amateur Photographer and Cinematographer," both parties are advised of its receipt. The time allowed for decision is three days, counting from receipt of goods, after which period, if buyer decides not to retain goods, they must be returned to sender. If a sale is effected, buyer instructs us to remit amount to seller, but if not, seller instructs us to return amount to depositor. Carriage is paid by the buyer, but in the event of no sale, and subject to there being no different arrangement between buyer and seller, each pays carriage one way. The seller takes the risk of loss or damage in transit, for which we take no responsibility. For all transactions up to £10 a deposit fee of 1/- is charged; on transactions over £10 and under £50 the fee is 2/6; over £50 and under £75, 5/-; over £75 and under £100, 7/6; and on all transactions over £100, one-half per cent. All deposit matters are dealt with at Dorset House, Stamford Street, London, S.E.1, and cheques and money orders should be made payable to Iliffe and Sons Ltd.

CAMERAS AND LENSES

WARNING

We have received many complaints from our readers in regard to the business methods of Mr. R. L. Green, trading as R. L. Green's Photographic Exchange, of 218, Fore Street, Edmonton, London, N.13.

For some considerable time we have refused to insert his advertisements in "The Amateur Photographer and Cinematographer," and from the complaints we have received it would appear that his practice is to communicate with private advertisers having goods for sale, offering to take such goods in exchange for others, or to purchase for cash. Readers are advised to ignore all such offers from this quarter.

CAMERAS AND LENSES

£9 or offer.—Rolleicord, leather case, 2 Agfa filters and holder, Agfa developing tank, tripod; value over £13.—Ingall, Three Ways, Haynes, Beds. [4401]

MOVIES with Colour.

THE Ilustrachrome Multi-colour Wheel will enable you to give your movies in a fully professional manner by introducing delightful chromatic and atmospheric effects.

YOU can present your feature opening with a blaze of glorious multi-tinting, and then throughout the subject create a sense of reality that you have never before enjoyed. Then at the end pass from sunset to twilight in restful conclusion, you will be more than satisfied with the knowledge that you have given a perfectly artistic presentation by employing this aid to better movies. Universal model to fit all projectors, including the B-200, 6/-.

THIS Week's Special Bargain.—Pathe Double-claw Projector, complete with super attachment, motor drive, dual resistance; condition as new, £8.

FILMS, 9-mm., 16-mm., 35-mm.; Pathe 9-mm. Super Films in great variety are available for hire to callers.

PATHE Super Films exchanged, 2/6 (plus 3d. postage) sent us with any Super Film you may desire to change will bring you a fresh subject from us; send one or two and try this service, it will more clearly convince you that this is a worth-while service than writing to ask about it.

ANY film supplied by us in this service will be taken in exchange for a further 2/6 at any time when another film is required.

WHEN sending film give a selection of numbers to indicate your preference; all the old favourites and new novelties available.

ALWAYS Available.—Big selection of Projectors, Bulbs, Motors, Screens, Lanterns, Resistances, Dimmers, Spotlights, Projection Tables, Rewinders; not a shop, but a warehouse packed with cine equipment.

ILLUSTRATION ENTERPRISES, 159, Wardour St., London, W.1 (facing Film House, Oxford St. End). Ger. 6889. [4450]

CINEMATOGRAPH Films, Accessories; standard only; lists free; sample 1/-.—Filmeries, 57, Lancaster Rd., Leytonstone, E.11. [4106]

9.5-MM. Fine-grain Panchromatic Reversal Film, 30-ft. 3/3, Processing 1/6.—Culbin Cine Company, 7, Cheapside, Palmers Green, London, N.13. [4434]

HAND CAMERAS

By R. Child Bayley

THIRD EDITION

An outstanding feature of this book, which makes a special appeal to all amateur photographers, is a number of separately printed plates, all from hand camera negatives by the author. These are selected to show the very wide range of subjects accessible to the snapshotter, from pure landscape to telephotographic portraiture.

Though primarily written for the beginner, "Hand Cameras" contains much of interest to the advanced worker, and should be in the working library of all who would attain to the highest degree of artistic excellence in their work.

THIRD EDITION

MOTION PICTURES

with the Baby Ciné

A Handbook on 9.5-mm.
Cinematography

By

HAROLD B. ABBOTT

This handbook, specially written for amateur cinematographers, includes every aspect of the fascinating hobby of making motion pictures.

In the preparation of this third edition a thorough revision has been carried out. Much additional information has been included, and all important new apparatus has been brought under review.

The following Table of Contents indicates the wide range of the book and the completeness with which the subject is covered.

THE PRINCIPLES OF CINEMATOGRAPHY.

For Miniature Camera Negatives 'PRAXIDOS'

VERTICAL ENLARGERS PRAXIDOS 'O' SEMI-AUTOMATIC.

The Praxidos "O" can be set for any degree of enlargement by simply releasing a lever. Focussing by lens mount.

Prices without condenser:
No. 453, with f4.5 anastigmat lens with iris diaphragm, for 4 x 4 cm. (1½ x 1½ in.) or smaller negatives, giving 1½ to 8 times enlargement £7:12:6

No. 463, with f4.5 anastigmat lens with iris diaphragm, for 6 x 6 cm. (2½ x 2½ in.) or smaller negatives, giving 1½ to 6 times enlargement £8:5:0

No. 473, with f4.5 anastigmat lens with iris diaphragm, for 3½ x 2½ in. or smaller negatives, giving 2 to 5 times enlargement £13:2:6

Single or double condensers can be used with Praxidos "O" Enlargers.

AUTOMATIC PRAXIDOS

Praxidos Automatic Enlargers give mathematically exact focussing—making pin-sharp enlarging virtually as simple as contact printing.

Prices without condensers:
No. 502, Praxidos with f3.5 anastigmat lens, with iris diaphragm, for 4 x 4 cm. (1½ x 1½ in.) or smaller negatives, 2 to 10 times (linear) £14:12:6

No. 508, Praxidos with f3.5 anastigmat lens, with iris diaphragm, for 6 x 6 cm. (2½ x 2½ in.) or smaller negatives, 1½ to 7 times (linear) £15:0:0

No. 491, Praxidos with f3.5 anastigmat lens, with iris diaphragm, for 6.5 x 9 cm. (3½ x 3½ in.) or smaller negatives, 1½ to 7 times (linear) £20:0:0

Single or double condensers can be used with Automatic Praxidos Enlargers.

THE *Leica*
takes snapshots at night

This photograph was taken at
F/3.5, with 1/30 second.

DEMONSTRATIONS from all high-class dealers.

E. LEITZ (LONDON), 20, MORTIMER ST., LONDON.

*Summer fun
on winter's evenings*

INEXPENSIVE NEW

Kodak Aids

*make
indoor picture-making
at night easy*

Fast Kodak panchromatic films, extremely sensitive to artificial light, allow big reductions in exposure times. Handy, low-priced lighting aids provide brilliant, easily-controlled illumination in any room.

Fireside portraits, a bridge party, the kiddies at bath-time—new pictures in plenty—start making them to-night!

KODAK SUPER SENSITIVE PANCHROMATIC FILM.

Three times as fast as regular Kodak Film to artificial light.

"PANATOMIC" FILM.

Not quite so fast as "S.S. Pan," but still very much faster to artificial light than regular Kodak Film. Superfine grain.

THE NEW "PHOTOFLOOD" LAMP.

THE "KODAFLECTOR" JUNIOR.

THE "SASHALITE" OUTFIT.

NEW "PHOTOFLOOD" LAMP.

Plugs into ordinary electric light socket; gives intense, continuous light; one and half times as powerful as earlier type, yet reduced to nearly half the price. Lasts for approximately two hours continuous burning time, sufficient for an immense number of exposures. Safety fuse incorporated 4/-

"KODAFLECTOR" JUNIOR.

Reflector for "Photoflood"; increases effectiveness of illumination two and half times. Supplied with handy wire stand that can be stood on table, hung from wall, over chair, etc., in a dozen useful positions. Complete with 9 feet of flex, but without lamp 6/-

"SASHALITE" BULB.

The powderless successor to flashlight. Flash takes place in sealed glass bulb, fired by ordinary torch battery. No smoke, no smell, no danger. Each bulb gives one brilliant flash. Allows night-time indoor snapshots to be taken with any camera.

Per bulb, 10½d.

Complete Sashalite Outfit containing 2 Bulbs, Battery in Holder, and Metal-surfaced Collapsible Reflector 7/6

F/3.5 Meyer Trioplan anastigmat, Compur shutter, speeds 1 to 1/300th sec., T. and B. **£7:7:0**
Nine monthly payments of 17/2.
F/2.9 Meyer Trioplan anastigmat, delayed-action Compur shutter, speeds 1 to 1/250th sec., T. and B. **£9:5:0**
Nine monthly payments of 21/7.

The WESTMINSTER

LONDON'S MOST POPULAR DEALERS!

The Leitz 'FOCOMAT' ENLARGER With Automatic Focussing.

Takes the standard 5-cm. focus Leica lens, screw-in fitting, automatic focussing adjustment, scaled from 2 diameters up to 10 diameters. Will take negatives 18×25 mm., 24×36 mm., 3×4 cm., and 4×4 cm. Metal masks can be supplied for any of these sizes. (Write for Leaflet).

£13:19:0

Nine monthly payments of 32/7.

The EXAKT ENLARGER

Fitted f/4.5 Steinheil Cassar anastigmat, complete with condenser and orange filter.

Very simple adjustment to obtain size of enlargement required.

THE ENSIGN MIDCET MACNAPRINT ENLARGER

F/6.3 Ensar enlarging lens, specially designed condenser for enlargements up to 15×12 in., chart giving various sizes. Will also take half-V.P.K., Leica, or other small negatives. Complete with electric fitting, less lamp.

£4:10:0

Model IA, for 2.5 to 10 times linear enlargements from 4×4 cm. negatives. **£13:10:0**

Nine monthly payments of 31/6.

Model II, for 2 to 7.8 times linear enlargements from 6×6 cm. negatives and section of i-plate. **£18:0:0**

Nine monthly payments of 42/-.

Model III, for 1.7 to 6.3 times linear enlargements from negatives up to $3\frac{1}{2} \times 2\frac{1}{2}$ and section of i-plate. **£19:10:0**

Nine monthly payments of 45/6.

Write for Leaflet.

The G.916 BOLEX PROJECTOR

PATHÉSCOPE 200-B PROJECTOR—9.5-MM.

OUTSTANDING FEATURES:

Fitted with highly efficient 250-watt direct lighting system, giving a brilliant screen picture 10 ft. wide. Flickerless projection. Very compact. Fan-cooled and asbestos-lined lamp-house. Simple threading. Universal tilting movement. Motor rewind for use on A.C. or D.C. supply, complete with lamp and motor drive for use on any voltage from 100 to 250 volts. 300-ft. empty reel and flex. Please state voltage when ordering. **£15:0:0**

Nine monthly payments of 35/-.

Specification.—2-in. f/1.6 Hugo-Meyer Projection lens, electric motor drive with forward and reverse movements, all gear driven. "still" picture device, motor rewind, air-cooled lamp-house and mechanism, separate controls for lamp and motor, stainless steel pressure plate and gate, simple masking device, ammeter, and variable resistance to lamp-house, direct lighting system. Very efficient outfit. Light and compact.

Price, with 110-volt 400- or 500-watt lamp for use on A.C. or D.C. current

£47:0:0

Nine monthly payments of 110s. 10d.

Resistance for use on voltages 200 to 250 volts **£2:10:0**

VOL. LXXXVIII. No. 2401.

THE Awards in our Annual Lantern-Slide Competition are published in this issue, and the entries have afforded another proof—if such were needed—of the tendency towards technical perfection in modern pictorial photography. While the number submitted this year was greater than ever, there were practically no bad slides. The standard throughout was very high indeed, and the judging, in consequence, was more difficult. With so many fine efforts, most of which showed a full appreciation of the advantages of panchromatic material, it was necessary to project the pictures repeatedly and weigh up minor differences before the winners could be decided upon. It will be noted that the awards have been increased, and the prize set starts on its travels among the British societies almost immediately. Every available date until May next has been booked.

Autumn Tints in Colour.

We hear from a correspondent who resides on the borders of the New Forest that the tints of autumn this season are exceptionally fine, and the same applies to many other districts. Doubtless many photographers will be making attempts to reproduce them upon the newly introduced colour films, which have the advantage of greater speed than the older colour plates. With the latter it was frequently a difficult matter to get good results, as exposures often ran into minutes, and at this season of the year wind is a troublesome factor. The colour photographer new to this branch of work should be on his guard against the tendency to include too much of a subject, or too wide expanses. These are very attractive,

TOPICS of the Week

A CORNER OF THE HARBOUR.

A modern treatment of a familiar subject. An article dealing with "Modernism" in pictorial photography will be found on another page in this issue.

but they fail to satisfy when they are reduced to the dimensions of a colour plate. The best subjects are those which cover a comparatively small area, and are composed of several vivid, contrasting colours. Autumnal tints, for example, are often shown to greater effect when the dark greens of firs or similar trees are included. The best time for these subjects is early morning, or after three o'clock in the afternoon, for the reason that the air is often still at these times, and the lighting softer in character.

The Emulsion Chemist's Performance.

So often when one hears of cinematograph achievements it is the actual operator who is lauded, with sometimes a word of appreciation for the designer of the camera. Therefore it was refreshing to hear Mr. S. Rowson, when opening the exhibition of cinematography at the R.P.S. House the other day, give a pat on the back to the emulsion chemist, who has successfully produced a light-sensitive material with a speed of one-fortieth of a second under all sorts of light conditions. But that is not all that the chemist has accomplished. The picture on the cinematograph film in the silent days was about one inch by three-quarters of an inch in size, and it is less now in order to accommodate the sound-track. But even at the larger size its projection on to a 24-ft. screen implies a linear magnification of nearly 300 diameters and a superficial magnification of 90,000. Yet, in the large picture on the screen at which millions gaze every night there is no emulsion grain visible in any part, nor any of the "sparkle" resulting from tiny holes in the emulsion which

formerly were too frequent. And perhaps most important of all is the uniformity of photographic quality which extends over every batch of film coming from the modern works. Whatever the story told in the picture, however vivid or vulgar, the photographic achievement is miraculous.

The Amateur, Too.

We were glad to hear Mr. Rowson, opening an exhibition of what was mainly professional work, say a kind word for the amateur. He mentioned, by the way, that the first amateur film of which any record exists was made in 1901 by Mr. E. W. Mellor—we believe the subject was a railway train—who died suddenly a few years ago in the very rooms where the present exhibition is being held. To-day the sub-standard camera and film have

found great popularity. Mr. Rowson estimates that about 150,000 such cameras are in use in this country, that in France the number is twice as great, while in the United States it is near the million mark. The amateur, generally speaking, said Mr. Rowson, has to work without the lavish resources of a studio at his disposal. He cannot use the almost unlimited illumination at the command of his professional brother. His picture is from one-half to about two-sevenths of the linear dimensions of the professional. His camera lacks some of the extreme refinements. Yet, in spite of these handicaps, he "gets there," and has marvellous results to his credit.

Convention.

A lantern slide of pictorial intention which was exhibited among

a group of photographers was challenged by one of them on the ground that on one side of the picture there projected the upper part of a tree; but no trunk or other foundation for the tree was visible. He declared that it caused mental agitation to find in a picture an object which must be supported from the ground, but in which no suggestion of such support was conveyed. On the other hand, a pictorialist of equal eminence exclaimed that the other was putting forward an absurd convention, and that the real consideration was not whether the tree had a trunk—which might indeed be inferred by the ordinary intelligence—but whether the mass of foliage gave the proper balance to the composition. The reconciliation of the two views seems as difficult as in theological or political controversy.

READERS' PROBLEMS

Selected queries on topics of general interest to readers will be fully dealt with on this page week by week. Other replies appear as usual on the last page.

Masks in Enlarging.

I have an enlarger taking negatives from quarter-plate downwards, and generally use two smaller sizes. I find a good deal of difficulty, one way and another, with getting neat borders by masking the film negative. What do you consider the simplest and best way of managing this?

E. P. (Hendon.)

Methods vary a great deal, and to some extent are influenced by the type of apparatus. It is therefore sometimes necessary to make some modification in any method that may be suggested, but as a rule the main ideas hold good. We take it

that you wish to mask off the edges of the prints, so that they can be trimmed to show a narrow white margin. We also assume that you wish to use different sizes and proportions of masks according to the requirements of the subjects.

In any case, apart from masking, it is necessary to hold the film negative in a suitable position, and quite flat, during the exposure; and for this purpose it is easy to prepare suitable

carriers. For your own purpose you will require a few pieces of clear, flawless glass of quarter-plate size. If you have no old negatives yourself you can no doubt get some from a photographic friend; failing this, a frame-maker will cut the pieces from a sheet of thin, clear glass.

After considerable experiment we consider that the type of carrier shown in the sketch is about the simplest and best, the mask itself being conveniently cut from the black paper used for packing bromide paper.

In the sketch the large rectangle represents the quarter-plate glass; the smaller one is the opening cut in the black paper. This is arranged to come centrally on the glass. It is made a trifle smaller than the negative, the opening just showing the whole of the image. The dotted lines indicate the edges of the mask which are pasted and turned over on to the back. This leaves the whole of the front of the mask lying free but flat on the surface. The triangular pieces cut out of the ends of the paper are important, as they greatly facilitate slipping a corner of the film under the paper, and either corner can be put in at either end of the mask in a moment.

The film is slid into position in the opening of the mask, another piece of glass laid on it to keep it flat and in position, and the complete "sandwich" put into the carrier of the enlarger.

Instead of making the mask opening the full size of the negative, other openings can be cut of suitable dimensions, in this case a separate mask being made for each size. There are two drawbacks to this. The first is that the edges of the opening are liable to get damaged; the second is that it is no easy matter to cut out a small rectangle so accurately that it will be perfectly true when considerably enlarged.

On the whole, therefore, we prefer to use the full-size opening always, and to do the masking on the print itself. This can be done in various ways. In the case of a glass-fronted enlarging easel, paper masks can be cut for laying on the glass, with the paper pressed close against them. With a vertical enlarger, if there is no mechanical masking arrangement, sheets of glass with masks pasted on them can be laid on the paper after it is put in position on the baseboard.

The use of SUPER-SPEED Plates and Films

With the coming of the shorter days many photographers will be making

their first attempts with plates or films of super speed. In the following article some hints are given upon how to make the best of these materials.

AT the present time of year there are many photographers who contemplate making their first attempt with super-rapid plates or films. Not only can successful results be secured out of doors under poor lighting conditions, with subjects the very nature of which prohibit long exposures, but the use of these materials opens up new and attractive fields of negative-making. In the home after dark, and out-of-door night photography, each and all offer possibilities through the increased sensitiveness of modern materials.

Ortho. or Pan.?

The photographer has to decide which of the high-speed materials he will use. Both orthochromatic and panchromatic plates and films can be obtained of high speed. With the latter there is a greatly increased speed to artificial lighting; in fact, for some pan. material it is claimed that the speed is four times faster under these conditions.

The choice of a plate or film will depend not upon its ability to render colour values, although this may enter into the question as well, but upon the sensitiveness as required by the character of the subject to be dealt with.

Care Necessary.

There is one point that the photographer who is intending to use these highly sensitive materials will need to consider. The camera must be in perfect order, and especially the slides, the light trapping, or the fitting of the back of a film camera, in order to avoid trouble arising from mysterious patches of fog on the negatives.

Cases have been known of cameras which gave no trouble with materials of slow speed that have produced negatives which showed slight patches of fog, when loaded with

super-rapid panchromatics. This particularly applies to roll-film cameras with the familiar little red window at the back. Several makers of high-speed pan. films have recognised the possibilities of fogging through this window, and supply a black adhesive patch to cover it when these films are being used.

Those photographers who have been used to plenty of red light in the dark-room are often diffident of their powers of being able to load slides or to carry out development in almost total darkness. In practice there will be found no difficulty in loading slides by touch. Development can be done by tank, or, if the photographer prefers it, desensitising of the plate allows of development being done under comfortable conditions.

Speed and Exposure.

In spite of the fact that the negative material has high speed, the secret of success lies in full exposure. In other words, the exposure should not be cut down for the sake of doing so in order to test the capacity of the plate or film for securing a negative with an exposure impossibly short. Many photographers fail at first when using these materials through failure to realise this point.

The ultra-rapid plate or film has actually a smaller margin of latitude in exposure than that of lower speed, and if the very finest negatives are required the exposure should be on the full side. A very short exposure may produce a negative of sorts, but a very little more will give a far better one.

Miniature Negatives.

The user of the miniature camera is the first to use the film of high speed. It enlarges his scope with regard to subjects, and in combination with a large-aperture lens it is possible to produce successful

negatives under conditions which would be regarded as impossible not so very long ago. Here again the photographer will find it well to expose fully, or "grain" will be evident in the negatives.

If the camera is fitted with a large-aperture lens, and the subject does not call for the very highest speed panchromatic material, it is well to consider the use of one of lower rapidity with the better negative quality which results.

Development.

The best results upon super-speed plates and films are only secured by careful development. They need rather longer development in order to produce a negative of the same density that would be secured by a slower speed emulsion in a shorter time. It will be found, however, with most panchromatic plates and films that density is gained very readily. For this reason over-development should be avoided or the negatives will be difficult to enlarge.

Super-speed materials vary considerably in the contrast of the negatives that they yield. Most modern films are expected to give a soft negative, and, these being exposed under harsh lighting conditions, this is as it should be.

On the other hand, when exposures are made out of doors under conditions where the lighting is weak, the contrast of the films may not be sufficient to produce a negative of full vigour. The plates and films by different makers vary in this respect, some giving a much more vigorous result than others.

If the plate or film is of the type which is intended to give an image of soft gradation, and the subject is of the low contrast type, the alternative is to use a developer which gives a vigorous image, such as pyro-soda or pyro-metol.

Woodland Photography

By R. M. FANSTONE.

THE present time of the year is the ideal for woodland photography. The dense foliage of high summer has become thinner, and the bracken has changed colour and died down. The lower position of the sun at this time of the year also produces long, interesting shadows and patterns over the foregrounds to delight the heart of the photographer. Woodland photography is very fascinating, but it must be admitted that it is not always easy.

The character of the wood is of first importance. The ideal wood for picture-making is one where there are a few well-grown trees separated from each other by well-lighted spaces, with a freedom from scrubby undergrowth. Such a woodland will be productive of masses of light and shade which are so necessary for these subjects. Often there is more shadow than sunshine.

The best time for these subjects is early in the morning or during the late afternoon when the sun is lower. There is also at these times a certain amount of mist, which very effectively subdues distances and unwanted details in the composition.

Careful composition is very essential in woodland photography. There must be some well-defined and prominent object in the foreground. The trunk of a tree can often be used to advantage when working against the light, to shield the lens of the camera from the sun.

A careful watch must be kept with a view to avoiding the awkward effects so often seen in woodland pictures, in which a tree in the middle distance appears as if growing out from the trunk of one in the foreground.

At no season of the year are there better opportunities for picture-making in the woodlands than the late Autumn and early Winter. The following article gives some hints upon this topical subject.

With regard to apparatus, almost any camera may be used, provided that it can be put upon a tripod, and a time exposure given. With the modern miniature camera fitted with

helpful in avoiding the bad notes in the composition referred to above, which are so easily overlooked in a view-finder.

Colour-sensitive materials are called for, preferably panchromatics with a light screen if the subject admits of the longer exposure. Wind is often a troublesome factor at this time of the year, and when a screen prolongs the exposure too much excellent results will be obtained upon un-screened "pan" material. Colour is everywhere in the autumn woodlands, but while it is easy for the inexperienced photographer to be led astray

by colour effects, these can be suggested very well by the use of modern panchromatic materials.

If plates are used they must be backed, or the results will be spoiled by halation. The chrome films now so popular will give excellent results, especially under trying conditions of lighting.

These subjects call for the use of an exposure meter, as the lighting conditions are very deceptive. Full exposure is always called for in order to render the shadow details, and the latitude of the plate or films should be sufficient to retain

Autumn Bracken.

an ultra-rapid lens and super-speed panchromatic film it is possible to make exposures in the hand successfully, under good lighting conditions, but the beauty of most woodland pictures lies in shadow detail as well as details in the lights.

The best results will probably be obtained with a camera fitted with a long-focus lens. Many excellent subjects are to be seen which appear quite different when approached sufficiently near to include only what is necessary, with a lens of normal focal length. A focussing screen is very

the quality of the high-lights.

The development of autumnal woodland exposures calls for no special comment except that over-development should be avoided, especially in the case of those subjects which contain strong lighting contrasts and delicate atmospheric effects, and especially when, as is often the case, these are found in combination.

It may be added that the worker of any natural colour process will find ideal subjects in the woodlands under the conditions suggested.

THE FIRELIGHT PORTRAIT

By
E. SMALLWOOD.

THIS particularly effective kind of indoor portrait is very easy to achieve with the aid of a fire (in an appropriate fireplace) and some flashpowder.

First lower or turn out the lights in the room and pose the sitter in front of the fire. This should be stirred to a blaze to enable you to study the best effect of the firelight itself.

The lights can now be raised again. Measure out the amount of flash powder necessary, according to the instructions given with the particular make of powder, the distance to be reckoned being that from the fire to the sitter, and put the powder in a piece of thin paper. The corners of this little paper packet should be twisted lightly together, but must not be screwed tightly, otherwise when the flash goes off, bits of burning paper may fly off into the room, to the sitter's discomfiture.

Now fix up the camera on a tripod or other firm stand, and focus on the sitter's face, for which purpose it may be advisable to get him or her to hold a lighted candle as near the face as possible, and at the same distance from the camera, i.e., not between the camera and the face. You can then focus on the candle flame and then insert your plate in the camera. In the case of a roll-film camera the focusing scale must be used and the distance carefully measured.

It is usually better to leave the room light on to avoid too black and undetailed shadows, and if the lens is only open for a few seconds, slight movement on the sitter's part will not register (hypersensitive panchromatic plates

or films should not be used), but a card must be hung just in front of the room light to prevent it shining into the camera lens.

A screen must now be arranged to hide at least half the fire from the camera, and then the lens can be opened and the paper containing the flashpowder placed in the fire in the corner protected by the screen from the camera, care being taken that the powder is not lodged behind a large lump of coal so that it cannot shine on to the sitter.

This placing of the flashpowder in the fire is the item that requires

greatest care, or it may go off too soon and the operator will be included in the picture. For this reason the best plan is to hold it in a loop at the end of a long piece of stiff wire, which can then be gently placed in position round the corner into the fire. The lens should be closed immediately after the flash. F/8 is a good stop to use.

If a gas or electric fire is used, the powder can be fired in the usual way, setting it up just beside the fire, and screening it from the camera.

HEATING THE DARK-ROOM

IN houses where electricity is installed the heating of the dark-room presents no difficulties. I have experimented with many methods of heating, but have scrapped them all in favour of the tubular heaters. They quickly warm up the dark-room to the required temperature, but at the same time do not illuminate it, so that panchromatic plates can be developed in safety.

In addition to warming the room, the electric tubular heater can be fixed in such a position that the developing, fixing and washing dishes are all kept at a working temperature.

My method is to fix to the wall a shelf made of wooden slats, upon which the dishes are placed. The heater is then fixed to the wall a few inches below the shelf, so that the warmth from the electric heater rises between the slats of the shelf and circulates freely around the dishes.

These electrical heaters can be obtained from most electrical stores and cost about 12s. for a three-foot length, which is sufficient to heat 100 cubic feet of atmosphere to 55 degrees Fahr.

The consumption of current is very small, especially when the dark-room is heated only when developing or printing is being done.

G. F. GARDINER.

(Seen through Wall)

Still Life.

THE vogue which seemingly for lack of another epithet is called "Modern," has been invading photographic pictorialism for some time. In some quarters this trend has been loudly denounced as entirely lacking in beauty. The belief that art is perforce beauty is so ingrained in the creed of the average man, that to see on the walls of an exhibition professedly devoted to pictorial photography some weird subject, portrayed with all the photographic skill that the worker is capable of as its apparent sole merit, comes as a rude shock.

The print is surveyed with a critical eye (and our average man is a law unto himself—in his own opinion—on art) and accordingly to the tenets of art is found wanting. Composition in the "modern" picture is usually entirely absent, literary appeal is often *nil*, romance there is none.

Yet cannot a good word be found for such efforts?

There is one thing that must count in the "modern" print without exception: the worker sets himself the task to achieve his result by the aid of photography alone. Let us not blind our eyes to the painful fact that pictorial photography in the usual picture often requires, in order to attain success, a little judicious helping with another form of art (or craft). The bromoil process is outstanding in this respect.

We think the workers in the "modern" school have realised that the camera, being able at only very rare intervals to record the effects of Nature, are trying to create a different form of art expression altogether, in which the result must exist

Buildings and Steps.

Low Tide.

"MOD"

By F. READ.

purely as a product of the peculiar characteristics of the camera lens, aided by the scientific flawlessness of photographic technique controlled and directed by the man with no other help whatsoever.

Viewed in this light the "modern" picture can be seen from a different standpoint, and every sincere and enthusiastic camera owner will be surprised at what great heights the technique of some of the exponents

has reached if they give an odd hour in trying to secure pictures showing like characteristics.

The prints illustrating this article are the writer's own "wee" efforts in attempting this pure, undiluted form of photographic art. All with the exception of "Coming Home" try to express the individual art of the camera. "Coming Home" is included as a foil to the

ERNISM"

Some pertinent remarks on the relationship between art and photography.

other prints, and is a romantic country scene that every camera owner loves to take but is yet definitely a painter's subject, for it has been secured by the camera as a pure result of chance which sent the cows along at a moment

Reflections.

when the camera was actually set to include a figure by the wooden rail as a fill-up to the otherwise empty road. How often do we photographers get a like subject that just needs something to turn it into a picture, and must envy the painter who forms most of his pictures as he wishes.

The other prints in comparison at once strike a different note. Their appeal, if any, is purely decorative, and their beauty the superb drawing by the lens of line and form plus the rendering by the plate of a whole chord of tones around a pattern that is in none along the prescribed rules that art lays down.

Heretical art, you may say; but who is the judge of art—the creator or the critic?

The object of this note is not to defend "modern" pictures. Let them live by their own worth if live they can. Who knows but that the future of photography lies along the path most suited to the inherent capacities of our medium, provided always that our results have that

A Modern "Landscape" Subject.

little touch of nature that makes the whole world kin.

In conclusion, "modern" work is just as interesting as any other branch of our unending hobby. It will make more demands on the amateur's technical powers, and will need the cultivation of the "seeing eye" as much as does orthodox pictorialism. It is a bit, maybe, above the head of the raw beginner, who dashes only at the popular subject, blindly passing by the subtle beauties that lie before him. At the same time, any type of camera may be used, but, if the maximum technical perfection is desired, panchromatic plates or films are essential.

"Coming Home." An Old-fashioned Landscape.

"The Amateur Photographer" ANNUAL LANTERN-SLIDE COMPETITION

AWARDS.

This year the entries again exceeded those of any previous lantern-slide competition held by this paper, and in addition to the large number of entries, the standard was appreciably higher throughout. The winning slides in the following list constitute a remarkably fine collection, representing a very high standard in slide-making, both technically and pictorially. In addition to those receiving awards, a considerable number have been purchased from the remainder to include in the circulating set for 1934-1935.

CLASS I. LANDSCAPE, SEASCAPE, AND RIVER SCENERY.

SILVER PLAQUES.—"Open Spaces: Wales," by Arthur Brook, Market Street, Builth Wells, Breconshire; "An Old Suffolk Watermill," by G. B. Kearey, 102, Esmond Road, Cheetham Hill, Manchester, 8.

BRONZE PLAQUES.—"Lambeth: Night," by George A. Slight, 18, Ewelme Road, Forest Hill, London, S.E.23; "Chiswick," by J. H. Clark, 304, Camberwell New Road, London, S.E.5.

CERTIFICATES.—"The Sombre Naero Fjord, Norway," by S. J. Beckett, Pineville Hotel, West Cliff, Bournemouth; "Mud," by E. W. Chadwick, 12, Linden Avenue, Dewsbury Road, Leeds, 11; "Landscape," by Frank Day, 15, Bryanstone Road, Bournemouth; "Fury," by L. Farrage, 57, Wouldhave Street, South Shields, Co. Durham; "The Song of a Bird," by G. A. Forman, 206, Hard Lane, St. Helens, Lancs; "The Farm Road in Winter," by Charles Green, 11, Pendle View, Foulridge,

Near Colne, Lancs; "The Moorland Farm," by Charles Green, 11, Pendle View, Foulridge, Near Colne, Lancs; "Japanese," by George Haines, Normanhurst, 4, York Road, Chorlton-cum-Hardy, Manchester; "Harvest Storm," by G. B. Kearey, 102, Esmond Road, Cheetham Hill, Manchester, 8; "Towering Cliffs and Winding Bays," by W. G. Kennings-Kilbourn, Kenlyn, Abbey Road, Chertsey, Surrey; "In Switzerland," by Fred Lord, Alandale, Crabtree Lane, Harpenden, Herts; "Summer Days," by Walter Shuell, 58, Dudley Road, Tunbridge Wells, Kent; "Evening Clouds," by E. Ronald Sleep, 46, Fisher Road, Newton Abbot, Devon; "Hours of Ease," by Miss Daisy Snoddy, Cherry Tree House, Penketh, Near Warrington; "Between the Rocks," by Henry Tolcher, Lynton, The Promenade, Colwyn Bay, N. Wales.

CLASS II. PORTRAITURE AND FIGURE STUDIES.

SILVER PLAQUES.—"Shoeing the Old Bay Mare," by T. Ambler, 18, Raby Gardens, Bishop Auckland; "Lazy Bones," by S. D. Barnwell, 209, Sandon Road, Stafford.

BRONZE PLAQUES.—"Court-yard, Losoni," by Miss Daisy Snoddy, Cherry Tree House, Penketh, Near Warrington; "A Lune Fisherman," by Samuel Thompson, West Bank, Scottforth Road, Lancaster.

CERTIFICATES.—"Christmas Eve," by George C. Backhouse, 16, Sandhurst Grove, Harehills Lane, Leeds, 8; "Open Air Girl," by George C. Backhouse, 16, Sandhurst Grove, Harehills Lane, Leeds, 8; "Old English Custom," by Mrs. B. Rodney Bryant, Ross, Caldly Road, West Kirby, Cheshire; "Music Hall," by H. B. Church, 8,

Westbourne Avenue, Great Lever, Bolton, Lancs; "Paddy," by Miss Anne Jackson, 61, Richmond Grove, C-on-M, Manchester; "Robbery without Violence," by G. B. Kearey, 102, Esmond Road, Cheetham Hill, Manchester, 8; "L'Ombre," by C. Laundy, 9, Rothbury Road, Hove, Sussex; "The Village Pump," by R. C. M. Kermod, 80, Cambridge Road, Southport, Lancs; "Hello, There," by Richard Lee, 36, Gainsborough Road, Leicester; "Light on the Subject," by John Lemon, 31, Natal Road, Thornton Heath, Surrey; "Freckles," by A. E. Smith, 7, Clarence Avenue, Upminster, Essex; "The Lone Watcher," by Henry Tolcher, Lynton, The Promenade, Colwyn Bay.

CLASS III. ARCHITECTURE: INTERIOR AND EXTERIOR.

SILVER PLAQUES.—"Evening Sunlight," by Miss Alice Jackson, 250, Manchester Road, Burnley, Lancs; "The Gateway to the Lake of Thun," by A. C. R. Redgrave, 84, Norfolk Road, Cliftonville, Margate.

BRONZE PLAQUES.—"St. Mary's Church, Whitby (Floodlit)," by John J. Hartley, Craven Bank House, Colne, Lancs; "Tithes Barn, Wilmington," by Miss M. K. Lack, 57, Baldry Gardens, Streatham Common, London, S.W.16.

CERTIFICATES.—"In York's Shambles," by George C. Backhouse, 16, Sandhurst Grove, Harehills Lane, Leeds, 8; "St. Stephen's Hall, Westminster," by S. J. Beckett, Pineville Hotel, West Cliff, Bournemouth; "A Gleam of Sunlight: Caen," by Edwin Dodshon, Durham House, 124, Old Christchurch Road, Bournemouth; "The Portal," by Edwin Dodshon, Durham House, 124, Old Christchurch Road,

Bournemouth; "Finsbury Circus," by Martin Gibbs, 2, The Orchard, Welwyn Garden City, Herts; "An Old Doorway, Shrewsbury," by Charles Green, 11, Pendle View, Foulridge, Near Colne, Lancs; "God's Acre (by Floodlight)," by John J. Hartley, Craven Bank House, Colne, Lancs; "Corbel (Telephoto) Lion versus Dragon, Percy Shrine, Beverley," by H. E. Illingworth, Carlyne, Leadhall Lane, Harrogate; "Figures on Tomb: York," by J. Ludlam, 115, Grassmere Street, Leicester; "National Gallery: Night," by George A. Slight, 18, Ewelme Road, Forest Hill, London, S.E.23; "Shadows of Remembrance," by A. W. Smith, 33, Commercial Road, Bulwell, Nottingham; "Sun Pattern," by J. V. Spalding, 19, St. Barnabas Road, Cambridge.

CLASS IV. FLOWERS, FRUIT, AND OTHER "STILL-LIFE" SUBJECTS.

SILVER PLAQUES.—"Pampas Grass," by J. H. Gray, 10, Beresford Road, Bedford; "The Shadow," by W. G. Kennings-Kilbourn, Kenlyn, Abbey Road, Chertsey, Surrey.

BRONZE PLAQUES.—"Norwegian Loving-cups," by S. J. Beckett, Pineville Hotel, West Cliff, Bournemouth; "Silks," by G. B. Kearey, 102, Esmond Road, Cheetham Hill, Manchester, 8.

CERTIFICATES.—"Sunlight Treatment (Sydenham Infants' Welfare)," by E. J. Bee, 70, Senegal Road, London, S.E.16; "Water-lilies," by G. W. Bott, 407, Yardley Road, South Yardley, Birmingham; "St. Anthony and the Holy Child (Caen),"

by Edwin Dodshon, Durham House, 124, Old Christchurch Road, Bournemouth; "May Blossom," by George Haines, Normanhurst, 4, York Road, Chorlton-cum-Hardy, Manchester; "Christmas Roses," by Reginald A. Hamer, May Lea, 13, Mayfield Avenue, Halifax, Yorks; "Altar Chair Carving, Cartmel Priory, Lancs," by H. E. Illingworth, Carlyne, Leadhall Lane, Harrogate; "Rope," by R. C. M. Kermod, 80, Cambridge Road, Southport, Lancs; "Silver, Glass and Pewter," by Fred Lord, Alandale, Crabtree Lane, Harpenden, Herts; "Brassware," by T. Raybould, 6, Willows Road, Walsall, Staffs; "Mushrooms," by D. G. Wraith, 41, Branksome Wood Road, Bournemouth.

CLASS V. NATURAL HISTORY SUBJECTS.

SILVER PLAQUES.—"Brown Squirrel Feeding," by Richard E. Booth, Alvenga, Kirk Ella, E. Yorks; "Polar Bear," R. W. A. Burgess, Ben Bhan, Dimsdale New Road, Wolstanton, N. Staffs.

BRONZE PLAQUES.—"Flight," by A. V. Bibbings, 54, Queen Street, Newton Abbot, Devon; "Male Merlin Settling on Eggs," by G. B. Kearey, 102, Esmond Road, Cheetham Hill, Manchester, 8.

CERTIFICATES.—"Gull Study," by A. V. Bibbings, 54, Queen Street, Newton Abbot, Devon; "Plover's Nest," by Richard E. Booth, Alvenga, Kirk Ella, E. Yorks; "Wild Badger at Sett (Flashlight)," by Arthur Brook, Market Street, Builth Wells, Breconshire; "Bruce," by Mrs. B. Rodney Bryant, Ross, Caldly Road,

West Kirby, Cheshire; "Renee," by R. W. A. Burgess, Ben Bhan, Dimsdale New Road, Wolstanton, N. Staffs; "Royal Python," by R. W. A. Burgess, Ben Bhan, Dimsdale, New Road, Wolstanton, N. Staffs; "Larva of Puss Moth," by John Clegg, 34, Scarisbrick New Road, Southport; "Paddy," by Edwin W. Deane, 129, De Beauvoir Road, Kingsland, London, N.1; "The Spider's Parlour," by J. H. Gray, 10, Beresford Road, Bedford; "Frog Spawn," by George Haines, Normanhurst, 4, York Road, Chorlton-cum-Hardy, Manchester; "Brown Rat at Bait," by G. B. Kearey, 102, Esmond Road, Cheetham Hill, Manchester, 8; "Nero," by Fred Lord, Alandale, Crabtree Lane, Harpenden, Herts; "Polyporus Squamosus," by W. Smith, 18, Pitt Street, Barnsley, Yorks.

CLASS VI. LANTERN SLIDES IN COLOUR (NOT HAND-COLOURED).

SILVER PLAQUE.—"The Thief," by T. Woods, 7, Easedale Road, Heaton, Bolton.

BRONZE PLAQUE.—"In the Beech Woods," by John Lemon, 31, Natal Road, Thornton Heath, Surrey.

CERTIFICATES.—"Where the Path Turns," by W. W. F. Pullen, Wellington House, 11, Lawn Road, Southampton; "On the Dochart at Killin," by Miss Isobel Simpson, 369, Blackness Road, Dundee; "Winter," by A. E. Smith, 7, Clarence Avenue, Upminster, Essex; "Cottage Window, Near Feckenham," by Bernard Wakeman,

Ombersley, Dartmouth, Devon; "Scorcher," by Bernard Wakeman, Ombersley, Dartmouth; "Cinerarias," by Bernard Wakeman, Ombersley, Dartmouth; "Doris," by Bernard Wakeman, Ombersley, Dartmouth; "Mansell Lacy," by Miss M. Wight, Thornleigh, Mordiford, Hereford; "St. David's," by Miss M. Wight, Thornleigh, Mordiford, Hereford; "A Country Cot," by T. Woods, 7, Easedale Road, Heaton, Bolton.

CLASS VII. CHAMPION CLASS. OPEN ONLY TO THOSE WHO HAVE WON SILVER OR BRONZE PLAQUES IN "THE AMATEUR PHOTOGRAPHER" LANTERN-SLIDE COMPETITION.

"Bella," by Mrs. B. Rodney Bryant, Ross, Caldly Road, West Kirby, Cheshire.

A Novel Daylight Developing Tank for Roll Films

AS every encouragement is now being offered the amateur photographer to develop and print his own negatives, the new "Optichrom Automat" daylight developing tank will

Fig.
1.

prove a most acceptable accessory for the regular user of roll films.

This tank is an ingeniously contrived piece of apparatus, and unlike some products of the enthusiastic inventor's optimism it works, and it has real practical value.

Fig.
2.

It is in two main parts—an outer shell or container, and an inner holder

for the film. The novelty of the tank is its ability to separate the roll film from its backing paper within the tank, retaining and coiling the film on a specially designed spool while the paper is drawn out through an opening in the side of the outer shell.

The developer is then poured into the tank and is drawn off again after the negative is developed. Fixing and washing are conducted in the same manner, and the film is not removed until finished. The whole operation can be conducted in daylight without risk of fog, and is ideal for the modern panchromatic film that must be kept in complete darkness during development.

Very full instructions for use are issued with the tank, and if these are studied carefully and a trial made with a dummy spool there appears to be no occasion for failures.

Fig.
3.

The illustrations herewith give a good idea of the method. Fig. 1 shows the spool being loaded into the inner part of the tank; 2, starting the paper backing with the lid of the tank lifted; 3, withdrawing the paper with the lid closed. While this is being done the film is travelling in a circular path

formed by continuous grooves in the inner chamber. These grooves are so arranged that while they hold the film by the edges there is ample space between each turn to allow the developer to act. 4, Pouring in the developer; 5, tank connected to cold water tap.

Fig.
4.

It is made in two sizes: No. 1 for films $2\frac{1}{4} \times 2\frac{1}{4}$ or $3\frac{1}{4} \times 2\frac{1}{4}$; No. 2, for films $1\frac{1}{2} \times 1\frac{3}{16}$ or $2\frac{1}{2} \times 1\frac{1}{2}$. The price

Fig.
5.

is £1 15s. for either size. It is obtainable from Sands Hunter & Co., Ltd., 37, Bedford Street, Strand, W.C.2.

THE "CELFIX" PROJECTOR

A HOME ciné projector that will attract hundreds of amateur cinematographers is the new "Celfix" which has just been put on the market by Messrs. R. F. Hunter, Ltd., "Celfix House," 51, Gray's Inn Road, W.C.1. This apparatus has many features of novelty that will appeal to the practical worker, notably as a universal apparatus for both 16-mm. and 9.5-mm. film.

A feature that is particularly attractive is the ease with which the change over from 9.5-mm. to 16-mm., or vice versa, can be effected. There are numerous

over from one to the other and have a collection of spools of film of both sizes in their possession. The "Celfix" makes the showing of both of these a matter of simplicity, as the necessary readjustment can be effected literally in a few seconds. This is done by the simple movement of a lever and replacing one film sprocket reel and film guide with the sprocket and guide for the other size. The whole of this can be done easily and quickly with the fingers, and without the aid of tools.

The apparatus itself is sturdily made to withstand hard wear, and all the parts have been selected and tested for their respective functions before being assembled. The picture projected by the "Celfix" is of unusual brilliance, and the makers claim that this is equal to that given by projectors having lamps of nearly double the wattage. This is achieved by the use of a condenser reflector unit, and there is no doubt that in practice the claim is made good.

The apparatus has a very efficient cooling system, which becomes still more effective when "still" pictures are

being projected. This is an important point, as many projectors which claim to be able to project "still" pictures blister the film after a very short stop. With the "Celfix," prolonged projection of any single frame from the film in use does not appear to have any bad effect. In addition to this "still" feature, for which a hand control is provided, the film can be projected forwards or backwards at will.

The projection speed is electrically regulated, and all controls are very conveniently placed to the hand of the operator. The lens is a 2-in. Dallmeyer "Superlite," which still further assists the brilliancy of the picture. The apparatus is fitted with adjustable screw feet, mounted on rubber, giving great stability on uneven surfaces.

The price, complete for 9.5-mm. and 16-mm. film (with reels for showing 400-ft. of film) and fitted with 250-watt, 110-volt lamp (A.C. or D.C.), in strong fibre-lined carrying-case, is £27 10s. Resistance for higher voltages can be supplied at an extra charge of £1 17s. 6d.

workers to-day who are either using both sizes of taking apparatus or have changed

NOTES & NOTIONS
for the
**LESS ADVANCED
WORKER**

UNSOUGHT SUBJECTS.

THERE are some photographic specialists who are so wrapped up in their own particular subject that they seem absolutely blind to all others. A man out for fungi will overlook a cathedral, and not notice the sunset. I think this is a mistake. It is quite right that the specialist should concentrate on his subject, but he need not therefore go about in blinkers.

It is my own practice to keep my weather eye open. (I am not at all sure what that means, but it sounds as though it means what I want it to mean.) It is a good thing to have, and to cultivate, powers of visual observation, not only when we are carrying a camera, but at all times; and it is also a good thing, when we do have a camera, to be ready and able to use it on any promising subject. Incidentally, this habit of mine of regarding as fish all that comes into my photographic net, has been of considerable financial benefit, and I shall have a word to say on this point presently.

Recently, I wanted one or two subjects that had to be taken from Bank Side. Conditions were favourable, and I not only secured the subjects, but sold them. On my way, however, I also took the subjects shown in Figs. 1 and 3, which are about as different from those I was out for as possible. Fig. 3 was in the nature of an experiment. I want it with one or two men busying themselves on this wharf, and one of these days I shall find it like that.

The subject in Fig. 1 is in a short street mainly filled with large modern buildings. But in one spot there is a quiet garden surrounded by old almshouses, and these and the old cottage have so far been spared. Not far from the cottage is the site of the old Globe Theatre, and it is highly probable that when the cottage was rather spick and span, Shakespeare's eyes must often have rested on it as he passed. Its age warrants the belief, and, anyhow, I consider the subject was worth an exposure.

When I photographed Fig. 2, a good many years ago,

Fig. 1.

Fig. 2.

I was exploring Dedham and the surrounding country, immortalised in many of the paintings of Constable. I suppose I had some optimistic idea of making Constable landscapes with a camera; if so, I can only say that my optimism was far from justified by results. But I got a good many interesting records, and a number of them turned out to be quite a success from the financial standpoint.

This is not the place to tell the story of the group of buildings of which Fig. 2 shows one corner. They belong to the old days when Flemish weavers settled in our eastern counties, and laid the foundation of the woollen industry, which transferred itself to the Yorkshire coalfields when the age of steam arrived. Some of the buildings have been modernised, but bits remain in their original quaintness and beauty.

One Dedham family especially controlled the local woollen industry, and so flourished that they entirely rebuilt the church. One of the features of this fine building is a porchway with an elaborately carved vaulted roof, and amongst the devices are to be found several of the merchants' marks used by the weavers in their commerce.

I remember photographing part of the roof, by a device that is sometimes possible, and often useful. I focussed on a distance equal to that from the floor to the roof, stopped down the lens, put the camera on the floor with the lens pointing to the roof, and gave the necessary time exposure.

By reason of the trade-marks the roof is connected with the weavers' houses, as, indeed, is the whole church. The photographs thus become adapted for illustrating the very interesting story of the early weavers of Dedham, and thus acquire a definite commercial value. They are not of the topical character which so many amateur photographers try to secure in the hope of obtaining fees from newspapers—by no means an easy task. But there are still magazines and publications of a general rather than a topical character to which such illustrations and articles are attractive.

My chief point is that we should be on the watch for anything of the sort, even when we are looking for other

Fig. 3.

subjects; and we shall often pick up interesting records whether or not they have a commercial value.

W. L. F. W.

Simplicity of Gaslight Printing

A NOTE FOR THE BEGINNER.

GASLIGHT printing is by no means a difficult task, yet beginners are sometimes deterred by initial failures—failures which are due only to lack of experience regarding the essential processes and which would disappear with the gaining of that experience. By this, it must not be inferred that such processes are at all intricate; but since they form the basis of ultimate success it is necessary that their importance be properly appreciated.

The important operations are but two in number. They are (a) exposure and (b) development. Neither is more important than the other; but we may discuss them in the order in which they are encountered during practical work.

To estimate the exposure necessary with any negative and a given brand of gaslight paper, it is desirable to make use of the practical and well-tried method of the *trial strip*. This is now so well known that a description is hardly warranted, but for the benefit of newcomers to the hobby it might be

said that the object of the method is to compare (after development) the results of different exposures and to select from them that which is most satisfactory.

Needless to say, the strip upon which the exposures are made must always be a piece cut from or supplied with the actual batch of paper to be used when making the ultimate prints.

To make the exposures, the strip should be placed in contact with the negative over a range of fairly even densities, after which the whole may be inserted in the printing-frame as usual. About five exposures should be made, all at a distance of, say, 2 ft. from a 30-watt "Pearl" or similar type lamp. After covering about four-fifths of the negative with a blackened card, the first exposure of 4 secs. should be made. Then, withdrawing the card over a further one-fifth of the negative, a second exposure of 4 secs. may be given, and so on until the fifth and last exposure.

The most accurate exposure for the batch in question can be judged on glancing at the developed test-strip. But this

must be developed according to accurate methods or the trial will be useless.

It is always essential—except, perhaps, in expert "manipulation"—to develop to what is known as *finality*. This is the point at which contrasts appear at their maximum. But it need not mean that the result will be a contrasty picture, since the manufacturers have introduced a variety of papers which—*assuming development to finality*—embrace a selection of qualities ranging from delicate softness to black-and-white hardness.

The period of immersion necessary to reach this point varies somewhat with the different papers in popular use; but most manufacturers are now sending out instructional pamphlets giving approximate times for full development under familiar conditions.

As soon as development is complete the print is rinsed in plain water and transferred to an acid fixing bath. This immediately stops all further action. Fixing is continued for 15 minutes, and the prints are then washed in running water or a dozen changes and dried. A.

How I make my EXHIBITION PICTURES

No.
CCLV.

—
Dr. R. S.
ILLINGWORTH

Methods and Ideals of well-known Pictorial Workers.

From information communicated to our Special Representative.

"IT was in 1931, five years after I had taken my first photograph, that my exhibition work began. In August of that year I took the plunge properly, and did a rash and unwise thing in submitting a batch of prints for the annual exhibition of the Royal Photographic Society; unwise, because the beginner should always go forward by stages, starting with the smaller open exhibitions, and only going on to submit to the major exhibitions after months of experience. However, much to my surprise, I had four acceptances, and this proved to be the beginning of a great deal of exhibition work.

"Exhibition work can only be learnt by studying the prints, and listening to the advice of others. I never fail to visit exhibitions in the vicinity; there is a great deal to be

learnt from them. I do not mean to imply that the works therein should be copied, but that one should learn from them the essentials of composition and technique, and the elements of design and effect. If one cannot visit exhibitions, one can buy such productions as 'Photograms of the Year' and 'The Year's Photography,' and study the art pages of *The Amateur Photographer* and other magazines to see what good work really is.

"Helpful criticism from a photographic society is an important item in the would-be exhibitor's equipment. I have profited greatly from advice given me by members of the Harrogate and the Leeds University photographic societies, both by word of mouth and by travelling portfolios. Careful critical examination of the technically perfect photographs in some of the non-

photographic papers and magazines has also been a great help to me in teaching me the essentials of technique.

"I have little time for retouching, and this has caused me to rely very largely on technique; good craftsmanship and care in selection obviate a great deal of the need for retouching and faking, which all too often is used to make up for technical defects. All the same, I have no objection to control where control will improve the photograph.

"Of films and plates I have tried most makes, and found that for all ordinary subjects one is as good as another. By far the most successful spool I have ever taken was a strip of four taken on a cheap film in a cheap camera one winter's day in January. The exposures made on that film of four brought me a silver cup, six prizes, numerous reproduction fees, and twenty-two acceptances in open exhibitions, including the Royal.

"For landscape work in which the rendering of skies is an important matter, I generally use Selochrome or Selo panchromatic film, with a filter which has a 2x factor for such films.

"The cameras I use include a Sanderson, a Zodel de Luxe, a Voigtlander Brilliant, and a Kodak 1A. The make of camera and the price thereof are not really as important as the way the camera is used. Any camera and any film will, in ordinary conditions, and with proper usage, give perfect results.

"Developing I do by the time and temperature method, modified slightly according to subject, and somewhat controlled by inspection. As to subjects, I specialise in pictorial photography, especially landscape work at home and abroad; in architectural photography, especially telephotographic and misericorde work; and in lantern-slide making. The photographs reproduced are, I think, typical of the work which most appeals to me."

PICTURES of the WEEK

Some Critical Comments on the Beginners' prints reproduced on the opposite page.

THERE is quite an interesting night study in No. 5 of the prints reproduced on the opposite page—"Liverpool: St. George's Hall," by A. Crighton—and how far a subject of this kind is enhanced by the presence of wet pavements is well exemplified. The print is also interesting in that, contrary to the usual run, the difficulty of handling unscreened lights is not avoided by their omission; nor does it seem to be fully appreciated, for one of them is boldly treated as the centre of interest and another group is introduced as a balancing accent.

Night and Day.

The inclusion of lights in this way, however, is seldom feasible. Whether it can be done or not depends, to some extent, on the characteristics of the lens, and, again, on the nature of the negative emulsion. Some of the very best of lenses are apt to let one down when subjects of this kind are attempted. They either render the light with certain peculiarities, or produce ghost images in other parts of the picture, and freak markings are not unknown.

If unbacked plates are employed, a spreading of light—known as halation—causes a partial obliteration of the image in their vicinity, and, either with plates or films, there is not infrequently a similar effect arising from a spreading of light within the emulsion itself, the latter being described as irradiation.

In the print under discussion, it is somewhat curious to note that, while the spreading of light is not marked in the case of the one in chief—that on the right—those forming the group on the left show it to an appreciably greater extent. Possibly this is explainable, in a measure, by the angle at which the rays from the lens strike the sensitive surface—the more acute the angle, the greater the spreading—but, however arising, it is only to a limited extent that the defect is tolerable.

Halation and Irradiation.

The light on the right might be regarded as acceptable, but those on the left appear as an unfortunate feature that would be better omitted.

Whether it be due to halation or irradiation—it is impossible to say which in the absence of full technical data—there is no doubt but that the impression it conveys is too exaggerated to be truthful.

In these circumstances, and while the experiment has provided a useful lesson, it indicates that the wiser course is to follow the general practice, and, as far as possible, arrange for naked lights to be hidden or excluded from the subject content. Apart from this, the subject is undoubtedly attractive and capably dealt with. It illustrates a class of work that is more easily essayed in the coming winter months than in the summer, for the opportunities are greater, and conditions generally more amenable.

Another subject from the same city is to be seen in No. 2, "An Early Start," by Edgar Honnor, where the sunshine of early morning forms the motive, and provides a contrast in type. The print is a bit on the heavy side, but the subject is well thought out and the figure beautifully caught.

Printing Depth.

It is probable that the idea in carrying the printing to such a depth was to obtain a suggestion of gradation in the brighter passages, but, owing to the somewhat extreme differences between the lights and the darks, the expedient has involved an overprinting in the latter.

This is a case where the choice of a softer grade of printing paper is indicated, for, with its longer range of tone, it would be able to render both extremes without over-emphasis in either direction. No. 6, "Morning at the 'Red Lion'," by Miss J. Bryan, has a range of about the same degree; but, here, the needed adjustment has apparently been made, for, while the sunlit portions display all the vital distinctions they possess, the shadows are likewise not without their measure of gradation.

No. 2, however, appears to have the advantage as far as the figure is concerned, for she seems to display no indication of a knowledge of the presence of the camera, while in No. 6 there is more than a suspicion of camera-consciousness. A comparison

plainly shows the desirability of avoiding a feature such as this.

Similar Characteristics.

A variation on a theme of similar characteristics is provided by Mr. T. G. Torkill in No. 3, "Vista of Kirk Street," but, in this instance, the lighter tones lose some of their values through a measure of underprinting rather than an error in the opposite direction or the choice of an unsuitable grade of paper.

A back view of the figure is shown, and, while it is preferable that the features should be visible, camera-consciousness can scarcely make an appearance. The print, in common with Nos. 2 and 6, has points of attraction, but, on the whole, "An Early Start" achieves the highest pictorial level—or would if the recommendations made concerning its treatment were carried out.

The principle has been carried out, again, in No. 4, "Cavalry Memorial," by Miss Phyllis Roney, though, in place of the living figure, a piece of statuary is included.

Dark against Light.

It serves quite well as the centre of interest, nevertheless, and the value of utilising the concentration of interest afforded by contrasts of extremes of tone is again exemplified.

The subject, however, seems to be one that would be more suitably treated by being shown the vertical way of the plate, and here, again, a greater depth of printing seems to be called for. It would provide just a little more distinction of tone in the bright tone of the buildings which form the background.

No. 1, "Assah Escarpment," by D. S. Foulkes-Roberts, more nearly approaches the ideal as far as depth of printing is concerned, but just a shade more depth would do no harm, particularly in the upper reaches of the sky. The feeling of space and light is nicely suggested, and the employment of the curiously isolated trees is not only clever but decidedly interesting. It would, however, have been an advantage if it had been found possible to include a somewhat greater proportion of sky.

"MENTOR."

Pictorial Analysis

Every week one of the pictures reproduced on an art page will be analysed in detail for the benefit of readers of the paper who are seeking to improve their pictorial work.

"THE COCONUT FETCHER," by Alfred Eisenstaedt.

THOUGH the nature of the trees is entirely different, and other distinctions are apparent, this picture, in a way, is reminiscent of the work by G. L. Hawkins, entitled "Autumn," which was discussed in these columns in the issue for the 31st of last month.

Distinctions and Differences.

In both instances the trees are displayed against a background of clouded sky. In both the trees are shown under the influence of sunshine, and their brightness of tone, at intervals, appreciably exceeds that of the sky.

The rendering of sunshine and the silhouetting of the trees is much about the same in effect, but, here, the absence of a foreground is marked; the clouds do not attain the same significance by any means; there is a cross lighting as compared with the more frontal illumination of the other; and the incorporation of the human element makes a further distinction, and a decided difference. Moreover, the tropical character of the trees and their foliage lends a note of unfamiliarity that imparts a touch of novelty to the presentment.

In connection with the lack of foreground, there is, inevitably, some loss of stability. It is largely countered, as far as its adverse effect is concerned, by the importation of the figure (1), and the presence of strong lights and darks in the upper portion towards the left-hand corner (2). These features incline the attention away from the base, and the absence of a firm foundation is not so severely felt in consequence. On the other hand, the brighter notes of the clouds (3) incline towards an opposing pull, and the good effect of the lighter notes above is naturally somewhat diminished.

In the balance, the pull of the figure and the accents in question just about

overweigh the other features, and prevent the lack of stability from assuming too great a significance.

Human Interest.

The figure, in point of fact, derives considerable importance from the note of human interest he excites. Being the only element of this nature, his attraction is greater as an animate

The cross lighting limits those portions of the tree trunks that are shown in sunshine. It is also inclined to stress the depth of tone in the shadows. Consequently, strong lights and darks are displayed in juxtaposition. This, compared with the generally flat effect of a frontal lighting, tends towards vitality and strength of presentment, and, as previously

mentioned, the position of these lights is not without influence in avoiding something of the suggestion of instability. In addition, their placing at the top of the print, in conjunction with the light tones of the clouds at the base, emphasises the figure which occurs in between.

In the former example, it will be remembered that the effect of sunshine found expression both in the cloud and in its influence upon the principal tree, any suggestion of divided interest being avoided by the placing of the two in close proximity. Here, the brightest notes are those at the top on the tree trunks, those of the clouds at the base, and, some little way behind, the light on the figure. It might be thought, perhaps, that the placing of the lights at the extremes of the picture—at the top and base—would tend to disperse the attraction by a division of interest, and, were it not for the figure and his unquestionable predominance, such a state of affairs might arise.

Unity of Interest.

The position of those lights, however, is weak, and they do not possess the same power of drawing the attention that they would if they were more in the picture, and their influence, compared with that of the figure, is negligible.

He forms the main point of attraction, chiefly by power of placing, and, instead of creating a division of interest, the lights in question emphasise his significance and enable his predominance to secure a sense of unity.

"MENTOR."

body in what, for all practical purposes, are inanimate surroundings. That attraction is stressed by the way his figure is isolated or shown in silhouette against the sky; to some extent by the contrast of tone within his outline; and, to an appreciable degree, by force of position.

Despite his small scale, all these factors in combination assure his dominance unquestionably, and, by the power of his attraction, the loss in stability is pretty effectively minimised.

Letters to the Editor

The Editor is not responsible for the opinions of his correspondents.

DEVELOPING TANKS.

SIR,—In view of correspondence regarding expensive tanks, I beg to submit the following:

(1) Lay the apron unrolled and flat on the table, rubber edges upward, and place a weight on the far end. Turn out the light. Remove film from its papers and stick one end on to far end of apron with adhesive tape. With emulsion side up unroll the film along the length of the apron toward you, and stick this end down a *little nearer* you than where it naturally falls. This ensures film being a little tighter than apron. Roll apron, film side outward, maintaining gentle tension against the weight. Place an elastic band around the roll.

N.B.—Tight rolling essential. Have everything ready to hand.

(2) Place a second band running across the ends of the roll, engage therein a hook made from a safety-pin, and lower the roll into a workman's tea can containing the developer. Agitate to remove bubbles, and place on the lid, which should have a deep flange to exclude light.

(3) Thereafter as usual—agitating the tank occasionally. After use dry and heat metal part to prevent rust.

The total cost, including a Kodak $2\frac{1}{2}$ -in. apron, is about 5s. I have had one failure due to negligently slack winding.

N.B.—Film cannot stick to paper.—Yours, etc.,
W. R. PARKER.

SIR,—May I, as a user of the Agfa tank, correct Mr. E. K. Robins' statement that certain films cannot be developed in this tank.

Films attached at each end to the backing paper certainly require more care and persuasion, but after a little experience one can load them without difficulty. Anyone who follows the instructions carefully need have no fear of disappointment.

Also films can safely be washed in the tank, provided the flush of water is gentle, and the tap *not* turned full on. It is not possible to assemble the parts incorrectly, as they will not correspond.

Having developed several different makes of film with satisfaction, I can recommend the tank. One does have to exercise a little care in removing airbells.—Yours, etc.,
C. J. BENNETT.

HOW CAN WE ADVANCE ?

SIR,—Mr. Geo. A. Slight, in his letter "How can we advance?" in a recent issue of *The Amateur Photographer*, hits the photographic nail squarely on the head.

"Mystery, romance and story in photography" is, I feel certain, the path along which we must advance. I shall look forward to an article by Mr. Slight along this line at an early date. He has seen the light!—Yours, etc.,

A. GREENSLADE.

"D. AND P."

SIR,—Kindly allow me a little space in your columns to join those amateur photographers who have a "grouse" against the professional dealer.

Some time ago I sent a panchromatic roll film to a local dealer, duly labelled "panchromatic." When same was returned to me, I found that the clips suspending the film in the tank had ruined my last negative.

Upon making enquiries I was informed that it was very difficult to clip the film so as to avoid the last negative, as the operations had to be carried out "in the dark"!

My film wallet was marked, "Develop only, pan., gd."

If a dealer professes to develop and print films, at least he requires to be familiar with the technique of handling same.

And by all means let's be provided with one service for the "button presser" and one for the worker who likes his negatives at least free from scratches and uneven density due to faulty drying. I have had some of both.—Yours, etc.,

W. H. LEWIS.

NEGATIVE FILING AND BROMIDE PAPER SIZES.

SIR,—Referring to the admirable article by M. Hirst, on the filing of negatives, he says: "One last word of warning. Always see that the negative is replaced in the correct position in the file, otherwise chaos will result." True, but how is one to know *quickly where* in the file a particular negative is to go? I suggest that to make the system complete there must be a linking-up number on the rebate of the negative! But what is one to use to write on celluloid film? Ink? No. Pencil? No. Copying Ink pencil? No. Then what?

Just a grumble to conclude. Why is it now that the $2\frac{1}{2}$ -in. square twin-lens reflex is so popular that one has such difficulty to obtain all the sundries one wants suitable to the size.

The sundries men tell me there is no demand. Rot! No demand with Rollei-flex, Superb, Rolleicord, Foth-Flex, Welta, Perfecta, Brilliant, all of this size, and thousands of people using them.

Why is it absolutely impossible for me to buy a piece of bromide paper for enlarging up on the $2\frac{1}{2} \times 2\frac{1}{2}$ in. ratio? If the English makers allow the Germans to capture the trade in this size cameras there is no reason why they (the Englishmen) should not have a few of the crumbs in the shape of the necessary sized sundries.—Yours, etc.,
J. L. SLADE.

MAKING UP DEVELOPER.

SIR,—My own experience is that it matters not at all in what order the various chemicals contained in M.Q. developer are dissolved. My chemist always puts the metol hydroquinone, sodium sulphite, and sodium carbonate all into one packet, and all I do is to merely tip the lot into the requisite amount of warm water, afterwards adding the bromide. I once had a bother with developer turning black, and the trouble was traced to using water that had been boiled in an iron kettle. Since heating the water in a tin kettle I have had no further trouble.—Yours, etc.,
F. J. OSBORNE.

THE COMPUR SHUTTER.

SIR,—*Re* your recent article on Compur shutters, the following experience of mine during this summer may be of interest.

I made a number of rapid exposures on the sands, using the delayed action.

On one occasion I set the shutter at $1/250$ th of a second and then set the delayed action, and went into the picture. The exposure was never made, and the shutter was quite out of action.

A Compur specialist in Hull took ten days to put it right; he wrote to the makers for a spare part and explained what I had I been doing.

They replied quite definitely that the delayed action *will not work* with the $1/250$ th of a second.

They explained that the same spring works both the D.A. and the specially fast 250 th, *but it will not work both together*.—Yours, etc.,
A. WILFRID TODD.

THE MINIATURE POSTAL PORTFOLIO.

SIR,—Presuming that it will be the intention of the proposed P.M.P.P. (South Africa) to adopt the Photographic Miniature Postal Portfolio (Britain) as its parent body, the publication of the letter *re* this in *The Amateur Photographer* is yet another instance of the quiet way in which "The A.P." takes part in fostering the co-operation of the amateur photographers of the world, and (probably) thereby better understanding between nations of the world.

As Hon. General Secretary of these portfolios I can promise that we shall be most pleased to co-operate with similar bodies abroad, and such knowledge or ideas, etc., that we have accumulated will be fully at their disposal.

In passing, it may be interesting for your readers to note that we are contemplating forming two *special* portfolios: one for absolute beginners, and another for very advanced workers. Enquiries should be addressed to: 18, Ewelme Road, Forest Hill, London, S.E.23.—Yours, etc.,
GEO. A. SLIGHT.

Amateur Cinematography

NEWS, NOTES AND MATTERS OF INTEREST FOR ALL CINEMATOGRAPHERS USING AMATEUR CINÉ APPARATUS.

Screen Psychology By R. H. ALDER.

GALILEO was executed by his contemporaries for suggesting that the earth rotated under the sun instead of the sun going round the earth; they regarded him as a revolutionary who wanted to turn the world upside down.

The popular habit of thought which ended the subversive philosopher persists to this day, notwithstanding lip-service to astronomical theory. Despite Einstein we do not believe that the landscape moves past the carriage window; we prefer to say that we are moving through the landscape.

In the cinema the screen is a window fixed in space, through which we look on a fragment of the world. If there is any relative movement our habit of thought makes us feel that it is we who have moved, not the screen, nor the fixed objects beyond it.

Moving the Audience.

To watch a tracking shot is proof of this—the audience has a feeling of actually moving about the set. A sudden change to very high angle will even make the more imaginative throw back their heads in an attempt to adjust their eyes to the proper inclination.

This psychological reaction, often overlooked, has a very real bearing on the work of the cameraman. Everyone knows it is bad to pan quickly; the reason is here evident. When the pan is projected it appears either that the landscape has travelled across the window or that the onlooker has been rapidly swung from one side to the other.

Ingrained habit tells us that landscapes do not move. Therefore we subconsciously accept the alternative, and our emotional reaction is that of a man hurled across the room.

High Jump.

But it is not only in panning that this effect must be borne in mind; the vertical angle affects us also. When an eye-level shot is followed by a high-angle view of the same scene we feel distinctly elevated, exhilarated. Similarly a drop to low-angle gives that catch in the breath when "your heart

is in your mouth," a feeling of awe or even fear.

Occasionally such motional shocks are legitimate. But when high and low angles rapidly alternate the audience feels nothing but that Channel-crossing nausea.

The same principle answers the question often asked in club circles—and often argued in circles, too!—whether a particular close shot should be taken literally close-up or alternatively with a long-focus lens?

When we are introduced to something new it is habitual to step up and look closely at it, and then to move back and examine it in its surroundings. The cinematic equivalent is to use a medium-angle lens both for close and medium shots.

True Perspective.

But when the director, in the middle

of a medium shot, wants to concentrate attention on a small action such as a hand filching documents, it is time for the cameraman to bring the four-inch lens round in the turret. Otherwise everyone in the audience feels as if he had suddenly jumped into the set for a close view and had been rudely thrown out again.

Some students of montage will laugh scornfully at this theory. Following their motto of "cut and come again," they build celluloid jig-saws of restless pattern.

Fortunately they are favoured by the fact that the sensation of bodily displacement is less pronounced when different objects form the shots which succeed one another rapidly on the screen. We recognise that a room may have more than one window and that the eye can dart from one to the other.

The Hunting Field now offers many fine opportunities for the amateur cinematographer. Unusual viewpoints or striking lighting effects, similar to the above, will help to enliven an otherwise hackneyed subject.

But the reaction, though subdued, is still there. Close examination of the work of acknowledged masters of montage shows that, consciously or not, they have appreciated that rhythm is an abstract of the dance—it is a relationship of time and space and not merely of time periods.

Rhythmic Cutting.

A series of carefully-cut unrelated shots, simply by giving the sensation of moving with different rhythms in time and space, can induce in the viewers the swirl of the valse, the glide of the fox-trot, or the throbbing of innumerable tribal dances that hammer out the elemental passions,

but the same shots cut with regard to time only can jerk the audience into a battered pulp.

At fun fairs there used to be an "attraction" called the Whip, which literally threw its patrons about in little padded chairs. Some people may like two hours of that. But not many!

The Ciné Exhibition at Russell Square

THE Royal Photographic Society is to be congratulated on the success of its efforts in the interests of amateur cinematography. The exhibition now open at the R.P.S. house, 35, Russell Square, W.C.1, continues the story started two years ago when a very fine historical exhibition of cinematography was staged. On that occasion, as our readers will remember, all the elements that went to make up the early work in motion photography, both for the professional and the amateur, were to be seen, and the history of this modern miracle could be traced step by step.

This year the exhibition concerns itself more particularly with the latest results and the most up-to-date apparatus that are available for the amateur cinematographer. These include several sound-film units in sub-standard size, a development which will open up a new field in home and educational cinematography.

The exhibition was opened on Tuesday of last week by Mr. S. Rowson, and our readers will be well advised to visit it at an early moment, if only for investigating the very complete display of apparatus that is to be seen in the two lower rooms.

Not the least attractive part of the show, however, is the collection of "still" photographs from professional and amateur films on view in the main gallery. Many of these films have not yet been released, but the chief interest in this section for the visitor will be the treatment of the different subjects portrayed, and the photographs taken in various well-known ciné studios during the production of big films. In several of these the entire set is shown with cameras and lights at work, and give a clear idea of the magnitude of the task involved in the making of a modern "movie."

Some of the stills from amateur films are also interesting, but the fact remains that while these are extremely good, in some cases they suffer by comparison with the professional productions. They, nevertheless, are an indication of the enthusiasm for this particular phase of amateur theatricals performed in front of a ciné camera.

Work by practically all the professional production corporations in this country is on view. These include Gaumont-British Picture Corporation, Ltd. (Gainsborough Pictures and Gaumont-British Pictures); London Film Productions; Twickenham Film Studios, Ltd.; British International Pictures, Ltd., and British Lion Film Corporation, Ltd. The amateur production societies whose work is shown include the Beckenham Ciné Society, G. G. Productions, Maestro Productions, Apex Motion Pictures, Ace Movies, Teeside Ciné Club, Brondesbury Ciné Society, Bolton A.C.A. and Martin Cross Productions.

The apparatus section will be found the most attractive to many. The following firms are represented:

The British Thomson-Houston Co., Ltd., of Rugby, who show a new 16-mm. sound-film projector with many outstanding improvements.

Cinepro, Ltd., 1, New Burlington Street, Regent Street, W.1, who are the sole distributors of Siemens and Halske ciné apparatus, have some remarkably fine models on view both of cameras and projectors for 16-mm. film.

Cinex, Ltd., of 70, High Holborn, W.C.1, show a range of all the well-known Paillard-Bolex apparatus; J. H. Dallmeyer, Ltd., 31, Mortimer Street, W.1, have a selection of their well-known lenses and other optical equipment, and the Victor Automatic ciné cameras and projectors.

Ensign, Ltd., 88-89, High Holborn, W.C.1, display the

Ensign Silent Sixteen projector and Ensign 16-mm. Kinecam cameras; G. B. Equipments, Ltd., Wardour Street, W.1, one of the Gaumont-British group, exhibit their latest 16-mm. sound-on-film portable equipment and accessories, and R. F. Hunter, Ltd., "Celfix House," 51, Gray's Inn Road, W.C.1, show their new Celfix projector for 9.5 and 16 mm. film.

Pathéscope, Ltd., 5, Lisle Street, W.C.2, exhibit the Pathéscope Home Cinema, Pathéscope projector, and the Pathéscope 17.5-mm. sound-on-film talkie; A. O. Roth, 85, Ringstead Road, Catford, S.E.6, has a projector to take alternatively 8-mm., 9.5-mm., or 16-mm. films, and a full range of ciné cameras; J. A. Sinclair, Ltd., 3, Whitehall, S.W.1, show the Newman-Sinclair Auto Kiné camera and other models of their well-known professional apparatus.

Soho, Ltd., 3, Soho Square, W.1, show the Kalee projectors which hitherto have been associated only with 35-mm. professional work. Their new introduction is for 16-mm., and is shown under the name of the "Kalee" N.P.3 Projector; Sands Hunter & Co., Ltd., 37, Bedford Street, Strand, W.C.2, display the Correx developing outfits for 16 and 35 mm. ciné film, and the Arri 16 and 9.5 mm. printing machines; Synchrophone, Ltd., 24, Berners Street, W.1, exhibit the Synchrophone unit in one portable cabinet, consisting of 16-mm. projector, gramophone and wireless set; Taylor, Taylor & Hobson, Ltd., Stoughton Street Works, Leicester, exhibit Cooke Speed Panchro and Panchro lenses; W. Vinten, Ltd., of 106, Wardour Street, W.1, show printing machines and developing plant for ciné film.

The Western Electric Co., Ltd., of Bush House, Aldwych, W.C.2, in addition to 16-mm. equipment, have a remarkable high-speed motion picture timing system taking up to 250 frames per second, and an ultra-speed model taking 2,000 frames per second. This is one of the features of the exhibition. In addition to this apparatus, all the other activities of the Western Electric Co. in connection with cinematography are staged; The Weston Electrical Instrument Co., Ltd., Kingston By-pass, Surbiton, Surrey, show the well-known Weston Exposure Meters.

Zeiss Ikon, Ltd., Mortimer House, 37-41, Mortimer Street, W.1, have an attractive display which includes their Kinamo cameras, of which the S.10 is the smallest clockwork motor camera taking 16-mm. ciné film; the new Movikon camera, for 16-mm., and the Kinox ciné projector, which is a remarkably fine piece of apparatus, are also on view.

Kodak, Ltd., Kingsway, W.C.2, have a very comprehensive display, including all the apparatus and accessories manufactured by them for amateur cinematography. This includes 16-mm. and 8-mm. Ciné-Kodak cameras and projectors.

The Association of Ciné-Technicians, of 30, Piccadilly Mansions, W.1, have a small but interesting exhibit that will attract attention in the shape of different phases of animated cartoon work. A considerable number of other items and accessories of interest to the amateur cinematographer will be found on the stands in addition to those mentioned above. The technical Press is also well represented.

The exhibition remains open to the public until Friday, November 30th, and lectures and ciné displays are given on Tuesday and Friday evenings at 7 p.m., and on Saturday afternoons at 3 p.m. The programme of these lectures was published in our last week's issue. Admission is free. A detailed catalogue of the exhibition is available, price 3d.

NEWS AND REVIEWS

ITEMS OF GENERAL INTEREST FROM ALL QUARTERS.

A new miniature camera, the "Retina," has just been put on the market by Kodak, Ltd. This little instrument takes spools of 36-exposure 35-mm. film, is equipped with Schneider Xenar f/4.5 anastigmat, Compur shutter, direct-vision view-finder, exposure counter, depth-of-focus scale, is beautifully made and finished, and measures $4\frac{1}{2} \times 3 \times 1\frac{1}{2}$ in. when closed. Its price is £10 10s. We will be referring to it again later.

Mr. Gilbert Cousland has recently added a very tall and gorgeous feather to the many already adorning his artistic hat, by producing "My Little A.B.C." This is a pictorial alphabet for children; but it is a great deal more. The full-page photographs give ample evidence of a loving understanding of the mind of the child; and one evidence of this, curious as it may seem to some, is that the book will be a delight to all nice grown-ups. Particularly will it provide inspiration for all photographers who appreciate beauty of form, design and idea. We seriously recommend our readers to secure a copy, ostensibly for the nursery perhaps, but incidentally for their own delight. It is a most attractive and artistic production, published at the low price of 3s. 6d. by Messrs. W. Collins, Sons & Co., Ltd., 48, Pall Mall, S.W.1.

The Twickenham Photographic Society has arranged a good programme of meetings for the winter months; one will be held every Thursday at 8 o'clock. This Society has doubled its membership during the past two years, and has now a fully-equipped dark-room in addition to a comfortable club-room at 116, Heath Road, Twickenham. The annual subscription is 7s. 6d. only, and new members are welcomed. All further information concerning the Society will be gladly given by the Hon. Secretary, A. S. Farris, 65, South Western Road, E. Twickenham, Middlesex.

The Eastman Kodak Company announce the appointment of three new Vice-Presidents. These are Dr. C. E. Kenneth Mees, who will be Vice-President in charge of research and development of the Eastman Kodak Company, Mr. Herman C. Sievers, who succeeds the late Mr. Lewis B. Jones, Vice-President in charge of sales and advertising, and Mr. Albert F. Sulzer, Manager of Kodak Park, Rochester.

A new society, to be known as the Bayswater and Paddington Photographic Society, has just been started. The first meeting was held at 113, Queen's Road, W.2. The Hon. Secretary is Mr. N. D. Toop, of 23, Leinster Terrace, W.2, who will be glad to hear from all photographers in the neighbourhood who are interested.

The annual dinner of the Photographic Dealers' Association was held at the Park Lane Hotel on November 6th, some 400 members and guests being present. Mr. Donald Foster, the President, made an ideal chairman, and the whole affair was a brilliant success, and thoroughly enjoyable from beginning to end. Mr. Wallace Heaton, who played an important part in the arrangements, is to be warmly congratulated on the result of his efforts. From the beginning of the reception at 6.15 p.m. till the final dances after 2 a.m. there was not a dull moment. Speeches were commendably few, short and good, and the keynote of the occasion was jollity. It is a striking fact that the membership of the Association has well passed the 10,000 mark, and there are over a hundred local branches.

The Blackpool and Fylde Photographic Society, which has been in existence for twenty-six years, has just appointed its first lady president, Mrs. B. Wild. The Secretary of the Society is Mr. R. S. Turton, of 10, Whitegate Drive, Blackpool, and the headquarters are at 41a, Market Street, Blackpool. Particulars regarding the Society will be sent on application to anyone interested.

A change of Secretary has taken place at the Phoenix Welfare Camera Club, this position now being occupied by Mr. John Thomson, of 350, Nuneaton Street, Glasgow, S.E.

In view of the demand for fine-grain developers, especially for miniature negatives, Messrs. Wallace Heaton have put one on the market. It is of Paraphenyline-Diamine-Glycin composition, and based on a well-tested formula. A special advantage is that no increase of exposure is required. A tin costing one shilling will make up 20 oz. of solution for tank development, and appropriate times are given for the popular brands of film used in small cameras. Special stress is given to the necessity for avoiding getting the solution on the hands, as irritation would be likely to ensue. With tank work it is quite easy to guard against anything of the sort. We have no doubt that many readers will hasten to take advantage of this valuable addition to modern developers.

The South London Group of the Kodak Fellowship is holding a meeting on Thursday, November 22nd, at 8 p.m., when a demonstration of enlarging and a ciné show of the 1934 Fellowship film will be given. All photographers and ciné workers are welcomed free. For further particulars apply to the Secretary, 401, New Cross Road, S.E.14, or phone New Cross 1903 for admission ticket.

"Eight for Sixpence."

Out of a very large number of entries for the £250 cash competition organised by Messrs. Granville Gulliman & Co., Ltd., for prints made from their paper films, the above picture, by Frank W. Murrell, of 23, Station Street, Spalding, Lincs, has been chosen by the Editor of "The Amateur Photographer" as the winner of the First Prize of £50. The dealers who developed the film, The Photo Trading Co., Ltd., of Change Alley, Sheffield, also receive a prize of £5.

The Week's Meetings

Societies will have their meetings announced here if the syllabus is sent to us at the beginning of the session, or from time to time.

Wednesday, November 14th.

Bethnal Green C.C. Practical Work.
Birkenhead P.A. An Evening with J. H. Williams.
Birmingham P.S. (Ciné Section). Best Holiday Films Competition.
Borough Poly. P.S. "Doing Denmark." E. P. Huddy.
Chorley P.S. Slide-Making. F. Sellars.
Coventry P.C. "The Cotswolds." W. Wilson.
Croydon C.C. "The Wandle." J. A. Sinclair.
G.E. Mechanics Inst. P.S. "Portraiture."
Handsworth P.S. "An Hour with the Naturalist." H. Thompson.
Ilford P.S. "Things that Matter." L. E. Vizard.
L.M.S. (London) P.S. "Personal Experiences in Picture-Making." W. Robinson.
Partick C.C. Visit to Dennistoun A.P.A.
St. George Co-op. C.C. "Portraiture." W. W. Weir.
South Suburban and C.P.S. Enlarged Negatives and Carbon Prints.
G. E. W. Herbert.
Stockport P.S. "Still Life by Artificial Light." H. Kitchen.
Worcestershire C.C. Carbo. J. N. Cockin.

Thursday, November 15th.

Ashton-under-Lyne P.S. "Pinhole Photography." W. Duxbury.
Aston P.S. "Chemistry as Applied to Photography." R. Clarke.
Gateshead and D.C.C. Bromide Printing. S. Gordon Hilton.
Greenock C.C. "Norwegian Fjords." Robert Ure.
Hammersmith H.H.P.S. "Colour Filters and Safelight Screens." S. O. Rawling.
Hinckley and D.P.S. "Picture-Making by Photography." S. Bridgen.
Hull P.S. "With Ciné and Camera at the Zoo." F. A. Jordan.
Keighley and D.P.A. "Lugano, Como and the High Pyrenees." J. C. Holmes.
Liverpool A.P.A. "Some of Nature's Oddities." Col. C. Theodore Green.
Loughborough P.S. "The Coasts of France and Italy." Rev. H. O. Fenton.
Newcastle and Dist. A.C.A. Film by James Cameron.
Northallerton and D.P.S. "Southern France." W. E. Gundill.
N. Middlesex P.S. "Some Folk and Fjords of Norway." Kenneth Baker.
Oldham P.S. "With Teat and Camera in the Highlands." H. P. Mitchell.
Richmond C.C. "The Venerable Order of St. John of Jerusalem." H. W. Fincham.
Singer C.C. "Midas Combined Ciné Camera and Projector."
Stourbridge Inst. P.S. Competition.
Tynemouth P.S. "The Mediaeval Craftsman." W. Maitland.
Watford C.C. Exhibition Week.
Wimbleton C.C. "Camera Sport in Mediaeval Cities." Miss Mary Tyler.
Woolwich P.S. Printing and Enlarging.

Friday, November 16th.

Bethnal Green C.C. "The Lens."
Hackney P.S. Outing: Hampstead.
Harrogate P.S. "The Lantern for Home Entertainment." R. Amey.
John Ruskin C.C. Slide-Making.
King's Heath P.S. "Wonder Mount of Brittany." J. E. Hall.
Leigh Lit. Society P.S. "Panchromatics." W. Whitworth.
Leytonstone and Wanstead C.C. Bromide Printing and Enlarging. A. P. Morris.
Photomicrographic Society. Members' Evening.
Royal P.S. Projection of Films.
Southend-on-Sea and D.P.S. "The Amateur Photographer" Prize Slides.
Wimbleton Ciné Club. I.A.C. Convention Week.

Saturday, November 17th.

Hammersmith H.H.P.S. Criticism of Monthly Competition. S. I. Ellick.

Monday, November 19th.

Ashton and Hirst P.C. "Here and There with a Camera." R. Chalmers.
Blackpool and Fylde P.S. Lecture by W. F. Taylor (Ilford, Ltd.).
Bournemouth C.C. "Miniature Cameras." R. M. Fanstone.
Bradford P.S. "A Chat on Pictorial Photography." S. Bridgen.

Exhibitions and Competitions

CURRENT AND FUTURE.

The Amateur Photographer Monthly Competitions for Beginners, Intermediate and Advanced Workers.—Entries, November 30. Rules in the issue of October 31.

Photographic Society of Ireland, Members' Annual Exhibition.—Open, November 26–December 1. Secretary, A. V. Henry, 34, Lower Beechwood Avenue, Ranelagh, Dublin.

Chicago International Salon.—Open, December 13–January 20. Entry forms from Salon Committee, Chicago Camera Club, 137, N. Wabash Avenue, Chicago, Ill., U.S.A.

"Northern" Exhibition, City Art Gallery, Manchester. Exhibits, November 14; open, December 8–January 9. Secretary, J. Chapman, 25, Radstock Road, Stretford, Manchester.

Western International Salon.—Entries, November 19; open, December 10–15. Organising Secretary,

W. H. Hill-Muchamore, 24, Church Road, Redfield, Bristol, 5.

8th International Christmas Salon of Photography, Antwerp, 1934–35.—Open, December 23, 1934–January 7, 1935; entries, November 15. Particulars and entry forms from Mr. J. Van Dyck, Secretary of the Fotografische Kring "Iris," Ballaerstr., 69, Antwerp, Belgium.

Madrid International Salon.—Entries, December 10. Particulars from the Secretary, Sociedad Fotográfica de Madrid, Calle del Principe, 16, Madrid, Spain.

Preston Scientific Society Open Photographic Exhibition.—Entries, January 11; open, January 28–February 16. Exhibition Secretary, F. Wells, 65, Powis Road, Ashton-on-Ribble, Preston, Lancs.

South London P.S. Annual Exhibition.—Entries, January 22; open, February 16–March 16. Details

and entry forms from Hon. Exhibition Secretary, H. S. Adams, 40, Stockwell Park Road, S.W.9.

Leicester and Leicestershire Photographic Society International Exhibition.—Open, February 25–March 2, inclusive. Particulars and entry forms from the Hon. Organising Secretary, W. N. Plant, 30, Harrow Road, Leicester.

City of London and Cripplegate P.S. Annual Exhibition.—Closing date, February 11; open, March 11–16. Exhibition Secretary, J. R. P. Hilliard, 80, Downton Avenue, Streatham Hill, S.W.2.

Scottish National Salon (Art Galleries, Ayr).—Entries (Overseas, March 9; Great Britain, March 23); open, April 20–May 4. Secretary, Arthur J. Nelson, 6, Hilary Crescent, Ayr, Scotland.

Brussels International Salon.—Entries, March 15; open, May 7–June 9. Secretary, M. Maurice Broquet, Rue du Sceptre, 77, Brussels, Belgium.

Readers' Questions ANSWERED

GENERAL.—All communications for the Editor should be addressed: "The Editor, *The Amateur Photographer and Cinematographer*, Dorset House, Stamford Street, London, S.E.1," and in every case, without exception, must give the name and address of the writer.

CONTRIBUTIONS.—The Editor is glad to consider original, up-to-date manuscripts on photographic subjects. All contributions must be typewritten, or in very legible handwriting on one side of the paper only. Letters or communications arising out of matters already appearing in the paper are not paid for. The Editor disclaims legal responsibility for the safety of matter submitted to him, but he will endeavour to return rejected manuscripts, etc., when a stamped addressed envelope is enclosed. MSS. or prints that are not actually accompanied by a stamped wrapper or envelope can in no case be returned. Reproduction fees for prints are only paid by arrangement beforehand. The sending of a print, without any condition stated, will be taken as permission to reproduce it without fee.

ENQUIRIES AND CRITICISM.—Advice, Criticism and Information are freely given, but the following conditions should be read carefully before applying, as any communication which does not comply with the rules must be ignored.

(1) See "General" above. (2) Every question and every print for criticism must be sent separately through the post, and must be accompanied by a separate stamped addressed envelope. No exception can be made in any case to this rule, except so far as enquiries or prints from Overseas are concerned. (3) Neither enquiries nor prints for criticism must be enclosed with competition prints. (4) On the back of each print sent for criticism, in addition to the name and address of the sender, must be the title (if any), and the criticism coupon from the current issue. (5) Enquiries should be clearly written, on one side of the paper only, and should be specific and not general. Such enquiries as "How can I take interiors?" or "Can you give me some hints on outdoor portraiture?" are too general to be dealt with in this section. (6) All envelopes should be distinctly marked "Query" or "Criticism," as the case may be. (7) Prints are sent for advice or criticism on the distinct understanding that by so doing permission is given for their reproduction without fee. We endeavour to deal promptly with enquiries, but cannot undertake to answer by return of post, nor can we give precedence to any enquiry.

A selection of those replies is printed each week, but all questions are answered by post. Enquiries from abroad must contain a coupon also, but it need not be from the current number, and should be cut from the latest issue to reach the enquirer.

Restoring Prints.

Is there any method of restoring the enclosed faded prints so that I could copy them?
A. W. (Edinburgh.)

Even if we were sure of the make of the paper of the prints you send we should not like to recommend any treatment of them. They have apparently been very carelessly produced, and to a great extent the photographic image has disappeared entirely, and probably nothing can restore it.

Copying.

Can you suggest a method by which I could copy engravings so that they fill a $3\frac{1}{2} \times 2\frac{1}{2}$ negative, using a box-form film camera?
J. A. W. (N. S. Wales.)

It is practically out of the question for you to attempt to copy engravings with a box camera, and no focussing screen. The whole thing is so difficult in the circumstances as to make it useless to attempt it.

Deposit on Negatives.

Can you tell me the cause of the white deposit on the enclosed negatives?
F. E. (Highams Park.)

The marks on your negatives are unusually pronounced, and it is only a surmise that they may be due to the character of the water you use, or to deposit from the developing solution. At the end of the final washing you should mop each side of the film while under water with a plug of cotton-wool, and, if this does not remove the deposit, you might try the addition of a few drops of hydrochloric acid to the water with which you swab them.

Uto Paper.

In "Photography of To-day" I find a reference to Uto paper for copying coloured transparencies. Is this paper still obtainable?
E. S. G. D. (Sidcup.)

The paper to which you refer was experimented with a great many years ago, but has long been out of date. It was never of much practical use, particularly as there was no way of fixing the image, so that it could not be long exposed to daylight.

Platinotype.

I understand that a platinotype print is permanent. Can you describe the process? I am only a beginner with limited resources.
J. A. G. (Crewe.)

Platinotype paper has practically gone out of use on account of its great expense, and for this reason we do not think that the matter would interest you, as you refer to your limited resources. It is certainly a permanent process, but the most expensive of all.

Scratches on Film.

What is the cause of the lines across the enclosed film negative?
W. E. C. (Salford.)

The scratches on your film are apparently abrasion marks due to the film being dragged over a rough surface. Such marks are often caused by winding the film when the camera is closed, so that the bellows are in contact with the emulsion; but in that case they are generally much more serious than in the example you send.

Lantern for Enlarging.

I have a projection lantern with 8-in. and 10-in. lenses. Can this be used for enlarging from $3\frac{1}{2} \times 2\frac{1}{2}$ negatives?
J. H. R. T. (Mountain Ash.)

We cannot answer your question off-hand. Apparently there is no reason why you should not use the lantern for enlarging, but owing to the long focus of the lenses you will want considerable room in which to work. One doubtful point is whether the lens will give sufficiently good definition to get the most satisfactory results.

Modifying Shadows.

How may one build up shadow in a negative by retouching? I have experimented with pencil with reasonable success, and I have tried building up by working with an old razor-blade, but cannot get much result.
J. G. (London.)

We are quite at a loss to know how you build up shadows by means of a razor-blade. We can understand the pencil work, but with a razor-blade or anything of the kind you could only remove density, and not introduce it. Further, a razor-blade is an almost hopeless makeshift, and you would have to use the proper retouching knives made for the purpose. If your idea is that you want to make shadows less transparent so that they do not print so dark, a good way of doing this is by painting over the areas with the red solution known as Coccin. Even this, however, requires a certain amount of practice and experiment.

Ciné Shows.

Could I hire ciné films, and exhibit them in a hall, charging for admission? L. M. (Talgarth.)

The first thing you must do is to interview the local police, and you will probably find that the restrictions on public cinematograph exhibitions are such that it will be quite impossible for you to comply with them.

Japanese Colours.

Will you give me the address of the Japanese Water Colour Co., or their agents?
J. E. H. (Hexham.)

We can only give you the American address, which is the Japanese Water Colour Co., Peerless Buildings, Diamond Place, Rochester, New York. We are under the impression that their water-colours are practically identical with the Velox colours sold by Messrs. Kodak, which are in stamp form.

Formalin.

I want to harden prints before glazing them, and have bought a bottle of formaldehyde. To what extent should I dilute it? Should I harden between developing and fixing?
J. A. H. (Greenford.)

You should take one ounce of the formalin solution as bought and add 9 oz. of water, and this can be used over and over again. You should not harden the prints until the end of the final washing, when you should place them in the solution and keep them moving for about four minutes, transferring them straight to the slabs without further washing.

Snow Subjects.

What exposures should be given for snow scenes? Shall I have to stop down? How could I remove a vast white foreground to obviate flatness?
J. M. V. (Rutherglen.)

All the points that arise in photographing snow subjects cannot be dealt with in the form of brief answers to questions. The exposure can best be arrived at by means of an actinometer, making the necessary allowance for type of subject. If you get a foreground of smooth white snow you cannot do anything satisfactory with it, and the proper course, as a rule, is to avoid such foregrounds altogether. It is more satisfactory when they are broken up by footprints or otherwise.

The PERSONAL touch

COLOUR YOUR OWN PHOTOGRAPHS BY HAND

WITH A **Kodak**

Soluble Crayon Outfit

It's easy! There's no need to be good at drawing; you don't even have to follow the outlines accurately, as transparent colours do not obscure them. If it does not look right at first, colour can be removed without the slightest damage to the print surface. By blending the crayons the most delicate effects are obtainable, and you can produce work which has individuality, and is really "your own."

REVISED THROUGHOUT AND BROUGHT RIGHT UP TO DATE

PHOTOGRAPHY MADE EASY

By R. CHILD BAYLEY
Author of "The Complete Photographer,"
"Hand Cameras," "Photographic
Enlarging"

AS EASY AS A · B · C

This is a book for photographic beginners, and, if carefully studied, it will enable the novice with a camera to get a greater proportion of successful photographs than would usually be the case.

"Photography Made Easy" should be read by everyone taking up photography: it should form as much a part of the outfit as the camera itself: it is an ideal present to give an amateur photographer.

The Amateur's Emporium

Prepaid Advertisements.

SALE AND EXCHANGE: AMATEURS ONLY—

12 words or less 1/-
1d. for every additional word.

PROFESSIONAL AND TRADE—

12 words or less 2/6
2d. for every additional word.

Each paragraph is charged separately.

SERIES DISCOUNTS are allowed to Trade Advertisers as follows on orders for consecutive insertions, provided a contract is placed in advance, and in the absence of fresh instructions the entire "copy" is repeated from the previous issue: 13 consecutive insertions, 5%; 26 consecutive, 10%; 52 consecutive, 15%.

All advertisements inserted in these columns must be strictly prepaid, and reach the offices, Dorset House, Stamford Street, S.E.1, not later than first post Friday for the following week's issue. Advertisements are inserted, as far as possible, in the order received, and those received too late for one issue, or crowded out, are published in the first following in which there is space. The Proprietors retain the right to refuse or withdraw advertisements at their discretion.

Box No. Advertisers

If a Box No. is required the words "Box 000, c/o 'The Amateur Photographer'" should be included in the charge, and an additional 6d. sent for registration and cost of forwarding any replies.

Letters addressed to box numbers are simply forwarded by us to the advertisers. We do not deal with the correspondence in any other way, nor accept any responsibility in connection with the advertisements.

Deposit System

Readers may deal in safety through our Deposit System. Purchase money should be deposited with "The Amateur Photographer and Cinematographer." The time allowed for decision is three days, counting from receipt of goods, after which period, if buyer decides not to retain goods, they must be returned to sender. If a sale is effected, buyer instructs us to remit amount to seller, but if not, seller instructs us to return amount to depositor. Carriage is paid by the buyer, but in event of no sale, and subject to there being no different arrangement between buyer and seller, each pays carriage one way. The seller takes the risk of loss or damage in transit. For transaction up to £10 a deposit fee of 1/- is charged; over £10 and under £50, 2/6; over £50 and under £75, 5/-; over £75 and under £100, 7/6; over £100 one-half per cent. All correspondence must be sent to Dorset House, Stamford Street, London, S.E.1.

Cheques and Postal Orders sent in payment for deposits or advertisements should be made payable to **ILIFFE AND SONS LTD., and crossed** & Co.

Notes being untraceable if lost in transit should not be sent as remittances.

CAMERAS AND LENSES

1-PLATE Field, good iris lens, tripod, 3 double 2 slides, 40/-—Poulton, Marlboro Rd., Ventnor. [4464]

WARNING

We have received many complaints from our readers in regard to the business methods of Mr. R. L. Green, trading as R. L. Green's Photographic Exchange, of 218, Fore Street, Edmonton, London, N.18.

For some considerable time we have refused to insert his advertisements in "The Amateur Photographer and Cinematographer," and from the complaints we have received it would appear that his practice is to communicate with private advertisers having goods for sale, offering to take such goods in exchange for others, or to purchase for cash. Readers are advised to ignore all such offers from this quarter.

CAMERAS AND LENSES

UNUSED Reflex, 3½×2½ Ihagee Folding, Zeiss Tessar f/4.5, in focussing mount, focal-plane shutter, 1/15th to 1/1,000th, cross front, hooded back focussing screen, direct-vision finder; cost £30; bargain for quick sale, £16/16.—Jarvis, 95, Ashburton Avenue, Croydon. [4465]

35-MM. Super-speed Panchromatic Cine Film, 10/6 100 ft., post free; during the past two years many of our customers have asked us for amateur cine requirements. We considered the advisability of taking a shop and displaying goods in the usual way, but this meant that we should have to sell at high prices; we have now had our offices re-decorated where amateurs may inspect our fine selection of accessories in comfortable surroundings. Our goods are of the best British manufacture—we deal in nothing second-hand. If you are unable to call send a postcard and your enquiry will be given the fullest attention. Remember, we have over ten years experience in professional cine work, and shall be glad to give you the benefit of our knowledge.—B. S. Productions, 1, Mitre Court, Fleet St., E.C.4. THE NEW "MIRA" DUPLEX ENLARGING FRAME

For Non-Automatic Vertical Enlargers

A new, useful, and universal enlarging frame for the amateur and professional photographer. The simple yet effective construction of the frame makes such a variety of effects possible, when enlarging from small negatives and composing the picture to obtain the best effect, that the "MIRA" frame will make friends everywhere. The most important points of the "MIRA" frame are:

- (1) The possibility of selecting any section of the picture when enlarging up to 10 x 8 in.
- (2) Simple adjustment for white border between 1 mm. and 5 cm. (1/25th to 2 in.).
- (3) Border-pressing attachment, with which each picture can be surrounded by a "plate-sunk" border.

"MIRA" Duplex Enlarging and Border-pressing Frame, for enlargements up to 10 x 8 in. **£3:3:0**

—It's sheer delight Enlarging with the simple, easy-working

'PRAXIDOS'

SEMI-AUTOMATIC VERTICAL ENLARGER

Specially made for miniature camera negatives, the PRAXIDOS "O" produces results of professional brilliance. Praxidos "O" Enlargers can be used with or without a condenser. Focusing is by lens mount.

No. 453.—F 4.5 anastigmat lens, with iris diaphragm, for 4 x 4 cm. or smaller negatives, giving 1½ to 8 times enlargements..... **£7:12:6**

No. 463.—As No. 453, but for 6 x 6 cm. or smaller negatives, giving 1½ to 6 times enlargements **£8:5:0**

No. 473.—As above, but for 3½ x 2½ in. or smaller negatives, giving 1½ to 6 times enlargements **£13:2:6**

Single or double condensers can be supplied for Praxidos "O" Enlargers. Full particulars in the Praxidos Prospectus, post free.

ENSIGN 'MAGNAPRINT'

For 3½ x 2½ in. or 4½ x 3½ in. negatives.

Double-lined lamphouse fitted with lampholder. Plated brass tube supports, numbered for focusing. Ensign 1/6.3 anastigmat lens, with iris diaphragm, Silvalux diffused lamp, alternating with red lamp fitted to standard. Carrier with masks for all sizes including half V.P. and Leica.

V/1. Takes 3½ x 2½ in. and all smaller negatives, 4½-in. condenser. Ensign 1/6.3 lens, enlarges up to 15 x 10 in. **£7:10:0**

V/2. Takes 4½-in. and 9 x 12 cm. and all smaller negatives, 6-in. condenser. Ensign 1/6.3 lens. Enlarges up to 20 x 15 in. **£10:10:0**

Lamps extra.

When ordering please state the voltage.

"LARCODREM"

ELECTRIC EXPOSURE METER FOR ENLARGING.

The perfect exposure meter for use with any make of vertical enlarger. The "Larcodrem" is simply laid on the baseboard, the light switched on, when the correct exposure for any make of bromide paper can be read on the scale. Obtain one of these invaluable meters and ensure correct exposure with every enlargement you make, and avoid wasting paper.

Price 30/-

When ordering please state the voltage.

THE 'AKRISKOP'

Focussing Magnifier

will enable you to obtain absolutely critically sharp enlargements from your small negatives. This is accomplished by intercepting a beam of light passing from the lens of the enlarger to the baseboard or easel, and adjusting the focus until the actual silver grains of the negative are seen in the "Akriskop." Nothing can be more critical than this.

TAKEN WITH AN
ENSIGN MIDGET

ENSIGN MAGNAPRINT SUPER SPEED CONDENSER ENLARGERS

Magnaprint Enlargers give you super-speed *without loss of quality*—the perfect diffused illuminant requires no adjustment and is concentrated on the lens by a powerful condenser. Fitted with special Ensar f/6.3 enlarging anastigmat.

For Miniature negatives—Ensign
Midget and $\frac{1}{2}$ -V.P. to 15" x 12"..... **£4.10.0**

For 2 $\frac{1}{4}$ x 3 $\frac{1}{4}$ —2 $\frac{1}{4}$ x 2 $\frac{1}{4}$ and smaller
negatives to 15" x 12"..... **£7.10.0**

ENSIGN, LIMITED, HIGH HOLBORN, LONDON, W.C.1

*Summer fun
on winter's evenings*

INEXPENSIVE NEW

Kodak Aids

make

*indoor picture-making
at night easy*

Fast Kodak panchromatic films, extremely sensitive to artificial light, allow big reductions in exposure times. Handy, low-priced lighting aids provide brilliant, easily-controlled illumination in any room.

Fireside portraits, a bridge party, the kiddies at bath-time—new pictures in plenty—start making them to-night !

KODAK SUPER SENSITIVE PANCHROMATIC FILM.

Three times as fast as regular Kodak Film to artificial light.

"PANATOMIC" FILM.

Not quite so fast as "S.S. Pan," but still very much faster to artificial light than regular Kodak Film. Superfine grain.

THE NEW "PHOTOFLOOD" LAMP.

THE "KODAFLECTOR" JUNIOR.

THE "SASHALITE" OUTFIT.

NEW "PHOTOFLOOD" LAMP.

Plugs into ordinary electric light socket ; gives intense, continuous light ; one and half times as powerful as earlier type, yet reduced to nearly half the price. Lasts for approximately two hours continuous burning time, sufficient for an immense number of exposures. Safety fuse incorporated 4/-

"KODAFLECTOR" JUNIOR.

Reflector for "Photoflood"; increases effectiveness of illumination two and half times. Supplied with handy wire stand that can be stood on table, hung from wall, over chair, etc., in a dozen useful positions. Complete with 9 feet of flex, but without lamp 6/-

"SASHALITE" BULB.

The powderless successor to flashlight. Flash takes place in sealed glass bulb, fired by ordinary torch battery. No smoke, no smell, no danger. Each bulb gives one brilliant flash. Allows night-time indoor snapshots to be taken with any camera.

Per bulb, 10½d.

Complete Sashalite Outfit containing 2 Bulbs, Battery in Holder, and Metal-surfaced Collapsible Reflector 7/6

KODAK LIMITED, KODAK HOUSE, KINGSWAY, LONDON, W.C.2

SUPER IKONTA

The Camera that does the focussing

The Super Ikonta, while possessing the ever-ready features of the well-known Ikonta, has an extra device for correct focussing . . . THIS IS THE DISTANCE METER.

Whether the subject is 5 ft. or 50 ft. away from the camera it presents no difficulty to the user of the SUPER IKONTA, as the distance meter by the simple rotation of a knob gets the correct distance, and at the same time sets the lens to that distance.

This eliminates guessing the distance and ensures you beforehand that you will get good pictures, because they will be sharp.

Supplied in three sizes:—

No. 520, for 16 pictures $2\frac{1}{4} \times 1\frac{3}{8}$ in. on the usual $3\frac{1}{4} \times 2\frac{1}{4}$ in. film, Zeiss Tessar f/3.5, and Compur shutter

£16:12:6

No. 530/2, $3\frac{1}{4} \times 2\frac{1}{4}$ in. (or 16 pictures $2\frac{1}{4} \times 1\frac{3}{8}$ in.), f/4.5, in delayed-action Compur shutter

£17:0:0

No. 530/15, $4\frac{1}{4} \times 2\frac{1}{2}$ in. (or 16 pictures $2\frac{1}{2} \times 2\frac{1}{8}$ in.), f/4.5, in delayed-action Compur shutter

£18:15:0

All good dealers stock the Super Ikonta. Folder free on request.

4-pl. T.P. Enlarger, Aldis f/4.5 anastigmat, 84-in. condenser, reversible carrier, roomy light-chamber. New condition. **£10 17 6**
2 1/2 in. square Voigtlander Superb, Skopar f/4.5, D.A. Compur shutter, focussing. New condition. **£14 7 6**
2 1/2 in. square Rollei-flex, Carl Zeiss Tessar f/3.8, Compur shutter, filter and leather case. **£12 17 6**
3 1/2 x 2 1/2 Soho Reflex, Ross Xpres f/4.5, 10-in. Dallmeyer Dallon f/5.6, interchangeable, focal-plane shutter, revolving back, 3 D.D. slides, F.P.A. and leather case. New condition. **£25 12 6**
3 1/2 x 2 1/2 Miroflex Folding Reflex, Carl Zeiss Tessar f/4.5, focussing, self-capping focal-plane shutter, 3 slides, F.P.A. and leather case. **£22 10 0**
3 1/2 x 2 1/2 T.P. Reflex, Plaubel Anticomar, self-capping focal-plane shutter, reversing back, 6 slides, F.P.A. and case **£9 17 6**
3 1/2 x 2 1/2 British Anschütz, Goerz Dogmar f/4.5, focal-plane shutter, 6 slides and leather case. **£8 17 6**

**IF IT'S NEW—
WE HAVE IT!**

ENSIGN MAGNAPRINT

The latest super-speed condenser enlarger for Ensign Midget, half-V.P., Leica, and other similar size negatives. With combined condenser diffused light system, making for speed, fine definition and contrast. Gives rapid exposures, 2 secs. for 2 1/2 x 3 1/2, 8 secs. for 4-pl., 15 secs. for 5 x 7 in. Metal throughout. Ensign f/6.3 enlarging anastigmat. Chart giving all sizes up to 15 x 12 provided on baseboard. Complete with all-electric fittings (without lamp).

£4 : 10 : 0

3 1/2 x 2 1/2 size, **£7 : 10 : 0**

T.P. IMPERIAL ENLARGER

Micrometer screw focussing front. Reversible negative carrier. Spring controlled carrier guide. Bellows connection between lamp-house and condenser. Removable diffuser. It is an ideal outfit for a beginner. 4-pl., without lens, from **£5 : 5 : 0**

Nine monthly payments of 12/3.

FOCOMAT ENLARGER

With automatic focussing. With effortless speed this enlarger will give perfect pictures from your Leica negatives whether you want enlargements to the size of 3 1/2 x 2 1/2 in. or up to 12 x 10 in. The diffused illumination gives soft, harmonious enlargements, and eliminates any possible scratches on the negative. Pre-eminently suitable for the enlargement of miniature negatives. For use with Leica camera lens

£13 : 19 : 6

Nine monthly payments of 32/7.

ZEISS IKON 'MIRAPHOT' 3 1/2 x 2 1/2 ENLARGER

For films and plates. The focussing handle is adjusted until the required size is observed; the exposure is then made and a perfect enlargement obtained. Zeiss Ikon Novar f/6.3 anastigmat **£7 : 12 : 6**

With Zeiss Tessar f/4.5 anastigmat **£10 2 6**
Nine monthly payments of 17/10 or 23/8.

IF IT'S NEW—WE HAVE IT!

ZEISS IKON 'IKOFLEX'

The latest twin-lens camera for 12 pictures on 8-exposure 3 1/2 x 2 1/2 roll film. Full size view-finder showing picture right way up. Depth of focus scale. Large finder lens giving perfect definition. Exact, quick, and easy focussing. Compensation for parallax. Simplified film-wind. Novar f/4.5 lens and Ikoflex shutter

£7 : 10 : 0

Nine monthly payments of 17s. 6d.

VOL. LXXVIII. No. 2402.

THE possession of a camera is often looked at askance at the Customs, but if some countries knew their business they would spread a special carpet over the frontier for any visiting photographer to tread upon. At any rate, they would grant photographers some special rebate in respect of railway fares and hotel charges, for undoubtedly photographers help to popularise travel. It is not merely the photographs used as advertisements or reproduced in some form or other which have a seductive effect, but the ordinary "snaps" of the visitor, shown to his friends on his return. One country which is waking up to the advantage of having photographers among its tourists is Algeria, where an official body, we see, is offering prizes for photographs. The first prize is 1,000 French francs (at the present rate of exchange, about £16), the second prize is 500 francs, and there are prizes of smaller denominations, including twenty-five of 50 francs each. The photographs have to be taken during the tourist season, and to be a personal record. Apparently it is an annual distribution, for each year's photographs have to be in by June, and are judged by a committee in July. If any of our readers are thinking of that sunny land the address is the Office Algerien d'Action Economique et Touristique, 26, Boulevard Carnot, Algiers.

A Million Feet a Day.

Such is the output of positive cinematograph film now consumed in this country alone, according to computations of the highest authority, the president of the British Cinematograph Society himself. It is the regular thing in quoting such figures to mention the distance of

TOPICS of the Week

LONDON LANDSCAPES (No. 28).

Sunset from Blackfriars Bridge. Taken with miniature camera on Agfa Fine Grain Super Pan Film. Exposure 1/25th sec. at f/4.5.

the earth from the moon, or the earth's waistline measurement, and a little arithmetic proves that the film consumed in a year, namely, 75,000 miles, would go three times round the equator. And that is Great Britain, mind you! The amount of positive film used in America is probably between five and six times as large, and the amount for the world at large can only be expressed in arithmetical figures. And now just a little contrast. Thirty-nine years ago, in 1895, the first year of the modern cinema, the quantity of film made by George Eastman's company—the undoubted pioneer—was 23,000 feet. This full year's product is put out every five minutes in America and every half-hour in this country, twenty-four hours a day and seven days a week.

When You Can't Go Wrong.

To take an ordinary photograph, unless one is a mere button-presser, does require a good deal of care and contrivance, a balancing of factors, a nicely calculated less and more. One feels all the time that one is working within narrow margins. But apparently the moving picture, which process might be supposed to be more complicated, allows a great deal more latitude, to judge from some experiences we have heard related recently. A gentleman who has been doing some film work abroad for a commercial organisation took with him, in addition to an assistant, several cinematograph cameras, with a wide choice of lenses and filters. Generally speaking, everything was plain sailing, but there was one unusual effect—a transient and peculiar atmospheric effect at dawn on a mountain—which he much desired to obtain. There was nothing to

guide him as to technique, and accordingly, for a hectic twenty minutes, he mobilised every camera he had, and made shots at every speed and with every lens and with every filter, hoping that one shot amid such diversity might prove to be the lucky one. Eight hundred feet were taken in this way by himself and his assistant, and in the result every single shot came out perfect! Unbelievable, but true.

A Photographic Calendar.

In Germany, we see, they are issuing some dainty photographic calendars for 1935. The frontispiece is a portrait of a young lady—not the slim tenuous sort of figure which appears in our own photographic advertisements, but a hefty wench in sports costume, holding an equally hefty camera at eye-level. Inside, to fold over, there are fifty-two postcard size pictorial photographs, one for each week of the year, and twelve larger size ones, one for each month. An idea for some enterprising publisher on this side of the North Sea.

In Foreign Parts.

A well-known London professional photographer who has recently been on a visit to foreign parts, including Egypt and Palestine, and farther east of Suez, has come back with a large number of photographs, all of them excellent. He confesses that he was deceived a little at first by the light, but afterwards he succeeded uniformly in getting good pictures by following a very simple rule. The rule was: Everything at $f/8$ with an exposure of one-hundredth of a second.

The "Still" Picture.

The splendid Goldsmiths Hall in the City of London was packed the other evening for a lecture by a well-known authority on gold and silver work, Mr. Omar Ramsden, who described some of his travels on the shores of the Mediterranean. He began with an apology—which was not altogether an apology—for showing "still" pictures. In these days of superb moving picture photography, he said, and even of excellent tourist ciné work, it

required some courage and some willingness to bear the reproach of being called old-fashioned to present an audience with "still" pictures. Yet for his own part Mr. Ramsden said that when watching films he always wished the better part of them would stand still, he was always inclined to call out "Halt!" at intervals, and he still rejoiced in ordinary photographs. Mr. Ramsden is by no means alone in his predilection. Movement in a picture can be a very great asset, but it can also be a disadvantage.

Dickens Flavour.

The Royal Photographic Society at its last meeting admitted to its Fellowship Mr. Sam Weller. The great original on one famous occasion sighed for "a pair of patent double million magnifying gas microscopes of hextra power," in order that he might see through a deal door. When his namesake joins the high confraternity of photographers science has so far advanced that there is hardly any such aspiration which cannot be gratified.

READERS' PROBLEMS

Selected queries on topics of general interest to readers will be fully dealt with on this page week by week. Other replies appear as usual on the last page.

Amidol that keeps.

It is commonly advised that an amidol solution for print development must be used within a few hours of its preparation. Can any variation in constitution be made so that the solution will keep for a few days?

C. L. G. (London.)

Several methods have been suggested for doing this, but the most popular rely on a stock solution of sulphite that will not quickly deteriorate, and to which the dry amidol is added at the time of use. As the same quantity of solution is generally made up for use, it is a simple matter to find a spoon or other small measure that will contain the required amount of amidol without weighing it out every time.

A stock solution of the kind referred to is:

| | | | | |
|--------------------------|----|----|----|-------------------|
| Sodium sulphite (anhy.) | .. | .. | .. | 2 oz. |
| Potassium metabisulphite | .. | .. | .. | $\frac{1}{2}$ oz. |
| Water to | .. | .. | .. | 20 oz. |

This may be boiled for a few minutes with advantage. The working solution is:

| | | | | |
|------------------------|----|----|----|------------|
| Stock sulphite (above) | .. | .. | .. | 4 oz. |
| Water to | .. | .. | .. | 20 oz. |
| Amidol | .. | .. | .. | 40-50 grs. |

Boric acid may also be used as a preservative, adding 25 grs. to each ounce of amidol solution; or lactic acid in the proportion of one part to fifty of solution.

The method given above will produce a solution that will keep in good working order for several weeks. No potassium bromide is included, but this to any required amount can be added from a 10 per cent solution.

A complete single-solution formula based on one suggested by E. J. Wall is:

| | | | | |
|-------------------------|----|----|----|----------|
| Sodium sulphite (anhy.) | .. | .. | .. | 290 grs. |
| Amidol | .. | .. | .. | 50 grs. |
| Lactic acid | .. | .. | .. | 50 min. |
| Water to | .. | .. | .. | 20 oz. |

This is, of course, the working solution.

Conjugate Foci.

Can you oblige me by repeating the method of finding the negative-lens and the lens-paper distances when enlarging?

F. J. W. (Lancaster.)

These distances are known as conjugate foci, as they have definite relationships, and come into play in practically every manner in which a lens can be used. For example, they apply in reduction as well as in enlarging, and also in copying and lantern-slide projection.

The first thing you must do is to find how many times the distance between two given points in the negative is contained in the distance between the same points in the enlargement. This is the number of "times" or "diameters" of enlargement. For example, you may find that you wish to enlarge two, three, four, etc., times, or diameters.

Now multiply the focal length of the lens by the number of "diameters" plus one. Thus, if you are enlarging three diameters, multiply the focal length by four. This gives you the "major" conjugate focus—that is, the distance from lens to paper. Now divide this distance by the number of diameters, and you will get the "minor" conjugate focus—that is the distance from lens to negative.

Example: You wish to enlarge from $4\frac{1}{2} \times 3\frac{1}{2}$ to 12×10 using a 5-in. lens. This may be reckoned as enlarging 3 diameters.

Major = $5 \times (3+1) = 20$ in.

Minor = $20 \div 3 = 6\frac{2}{3}$ in.

Development Troubles

The development of negatives and prints in the past was usually attended with a variety of minor defects and blemishes. Modern methods have done away with most of these—but some still remain to tax the resources of the amateur enthusiast.

NOWADAYS, troubles affecting the home development of negatives and prints are not nearly so prevalent as they were in the earlier days. Scratches, for instance, occur less frequently when a tank is used, whilst contamination, blisters, frilling and certain mechanical defects are now reduced to the absolute minimum.

However, even with the employment of modern methods, fog, veil, "pinholes" and local stains are still to be encountered.

Fog and Veil.

Although fog and veil are defects very similar to one another, they must not in any case be confused. Fog is the inevitable outcome of light leakage, whilst veil is usually due to prolonged chemical action or to the use of unbalanced developers.

With regard to fog, first, it becomes necessary to find out whether light leakage has occurred in the development or in the pre-development stage. Since leakage in development can occur only after the film is in the tank—or where visual development is still practised—during the unwinding operation, it is perhaps more likely that a leak in the camera or loose winding is the primary cause of the trouble.

Light leakage in the tank itself is not infrequently traceable to a damaged, ill-fitting lid; though where the tank is much worn it may be that a tiny hole has developed in one of the corners, or at any of the projection points similarly exposed to much wear.

Cases of veil are perhaps equally attributable to the use of a developer over-rich in accelerator, or to prolonged immersion in a standard developer, particularly if it is one weak in bromide. In the former instance, veil appears as an even degrading of the clear parts, whilst in the other case, in addition to veiling, evidence of coarse, granular forcing—sometimes accompanied by

mild stains—is to be seen affecting practically the whole of the work.

Incidentally, cases of veil occur more frequently with prints than they do with negatives and films.

Remedies.

A simple remedy for over-acceleration is effected by adding an increased quantity of restrainer. This is usually prepared in the form of a ten per cent solution of potassium bromide, which is added drop by drop whilst quietly agitating the main bulk of developer. Care should be taken to add not too much of the restrainer, as this may produce excessive contrasts in negatives, and may be responsible for bad colour in prints.

Light leakage in the tank can be detected by watching for drops of liquids to accumulate round the hole when the tank is full, or by properly testing the device in a darkened room. The usual procedure is to enclose a lighted pocket-lamp in the tank and to inspect the latter from all angles.

Remedies for pre-development fogging need not be discussed in this article; but, lest the fogging occur during the unspooling stage, it will be necessary to test the "safe" light and also the dark-room itself for unsuspected leakages of damaging light. In any case, sensitive material should not be unduly exposed to the dark-room light.

Pinholes, etc.

Having taken precautions to see that dust particles do not find their way to the film previous to development, the next point is to see that they are not produced during this operation. It may seem almost unnecessary to suggest that all chemicals should be thoroughly dissolved before use, but some photographers are not as careful as they should be in this respect. Particles of undissolved chemicals becoming attached to the film before it is thoroughly saturated

with developer, may produce pinholes, because they prevent the developer acting, or black spots, according to their nature. These pinholes which are caused by undissolved chemicals are easily distinguished. They are larger, and if examined under a magnifier they will be seen to be of uneven density, whereas the pinhole resulting from dust will be smaller, and of even sharpness at the edges.

Pinholes are seldom due to isolated spots on the sensitive material which have somehow or other escaped being covered with emulsion. They are more often than otherwise due to the formation of air-bubbles on the emulsion surface during development. As a result of these, the unchanged emulsion is removed during fixation.

To avoid this, it is necessary to flush the film or charged tank first with plain water; and only after this has been done should the developer be introduced. In certain localities, of course, the tap water may be highly charged with air bubbles. These may be reduced in proportion by allowing the charge to stand for some time before use—or air can be expelled by bringing the water to the boil first.

Other Notes.

If the fingers or gloves worn during development are contaminated with hypo, there is a danger of brown stains and other marks appearing on the finished work. To avoid this, the hands should be rinsed in clean water as often as it becomes necessary to alter the baths.

At this stage, too, both negatives and prints are extremely soft—especially on the emulsion surfaces—and are therefore liable to sustain scratches and other injury. The remedy here is to use a hardening bath before the washing stage. This may be employed by itself or in conjunction with the hypo fixing bath.

Window Display Photography

By
D. KIN.

A NOVEL NIGHT SUBJECT FOR
THE AMATEUR PHOTOGRAPHER.

"HAVE you permission to take that?" Six feet two inches of heavy, uniformed commissionaire towered above me as I stood opposite a West End store window, and gently lowered my miniature from eye level. Evidently expecting me to apologise profusely for daring to photograph one of Messrs. Blank & Blank's displays, he became very annoyed indeed when I told him that no permission was required to photograph anything from a public highway. However, I only laughed and took another, for they were the most attractive I had seen for some time.

Shop windows have been a favourite subject of mine for many years, but never have they been so easy to photograph as now, owing to the advent of small cameras fitted with fast lenses and loaded with speedy panchromatic film. This combination has opened up the subject in a most unexpected manner, and snapshot exposures will give excellent negatives of any well-lighted window.

Display photography may be considered from two standpoints. There is that of the photographer who does such work from a business motive, on behalf of shopkeepers—I heard of one amateur doing very well by taking windows for traders during the run of a display contest, which are usually judged on photographs submitted. On the other hand there are many shop windows in London and the provinces which show such art in their arrangement that they become well worth studying and recording by any photographer with pictorial aspirations. Some there are, also, which appeal irresistibly because of their originality.

A photographer taking windows from the former point of view naturally uses his camera on a tripod, with a small stop and a time exposure, so as to get a very

Spring Cleaning. F/11, 10 secs., S.G. Pan.

sharp result. Before fast panchromatic plates came into general use for this class of work, exposures of five to ten minutes were quite common, but now five to twenty seconds at $f/11$ will be sufficient. But there

is never any need to worry about this item; double this time will do no harm. It is not an exacting type of subject as regards exposures.

High gusts of wind will swing one's camera on the tripod at times, and motor headlights will cause streaks of light across the plate glass; for both these happenings during the period the shutter is open the remedy is the same. Cover the lens momentarily with a card which has been painted with matt black. Similarly, if a person stands in front of the window; but people passing along do not affect the image at all. Naturally this period must be added to the exposure time.

Since traffic conditions make it advisable to work always from the footpath, the wider the angle of the lens in use the easier it is to cover a large window, but I have, on occasion, stood a couple of feet into the roadway and always found drivers most considerate in going round. Of course, it is up to the photographer to keep an eye on approaching motors, and be ready to move if necessary.

A modern display will throw no glare into the eyes of the shopper, but tonal contrasts are often very strong, so that it is advisable always to use backed plates. This difficulty does not arise when snapshotting with a small camera, for the panchromatic films now have a backing dye incorporated in the film. The great depth of focus obtained with a large stop on a miniature enables $f/3.5$ or $f/2.9$ to be used with exposures of $1/10$ th or $1/25$ th of a second, and this method makes window-display photography very simple indeed, though a professional would probably despise it. But for those who might think twice before erecting a tripod for a time exposure on a cold winter night, this is the ideal method of experimenting with a subject which has a spice of novelty.

Any nervousness can be dispelled at once; commissionaires finish at 6 p.m., and window lights are on until nine o'clock at many establishments.

*The camera that laughs
at uncertainty!*

Rolleiflex

AUTOMATIC ROLL-FILM MIRROR REFLEX

Amazing is truly the word to express the way in which it gets such marvellous pictures. Everything possible is automatic. Its hair-sharp focussing eliminates all guess-work, and the picture you are taking can be seen, sharply defined and full size, on the ground-glass screen, even during the time you are making the exposure. Parallax compensation ensures that no vital points of your picture are 'chopped off.' Rolleiflex is fitted with single-lever Compur shutter, speeded up to 1/300th second, and automatic film-wind. All controls are conveniently placed in full view of the operator. It takes 12 pictures on 3½×2½ roll film for 1s.

Here's news!

The new
Kodak
Cassette

*Photography's latest thrill
at a record low price—*

The thrill of using a high-precision miniature camera with wide-aperture lens—the convenience of a camera which slips easily into your pocket or handbag—the economy of a camera taking 36 exposures at a film cost of 3/6—all this can now be yours if you use a

“Retina”

for only

£10.10

a new KODAK product

Takes 35 mm. Kodak Film.

Kodak's immense resources have made it possible to produce a high-precision camera of this type at this unprecedented price. Kodak experience and research stand behind the “Retina”—your assurance of finest craftsmanship and advanced technique.

Ask for Illustrated “Retina” Booklet.

SOME "RETINA" FEATURES

SCHNEIDER "XENAR" $f3.5$ LENS. So fast that the "Retina" owner is virtually independent of lighting conditions. With the "Retina" it is easily possible to take pictures indoors at night without special lamps or flashlight. Short focal length gives great depth of focus.

"COMPUR" SHUTTER with speeds up to $1/3000$ th second. Rapidly moving subjects can be snapped without loss of definition.

OPTICAL VIEW FINDER giving extremely clear image.

AUTOMATIC FILM-COUNTING DEVICE tells you how many exposures you have made. No red window to watch.

DAYLIGHT LOADING AND UNLOADING with new KODAK light-trapped Cassette. TWO fast Kodak films are available in this cassette; both cost $3/6$ for 36 exposures—

"PANATOMIC" FILM.

The superfine grain of this film makes it ideal for use in the "Retina," as the negatives bear exceptional enlargement without losing their original crispness. "Panatomic" film is fully panchromatic, it is fast to daylight, relatively faster still to artificial light. Use "Panatomic" for all general purposes in the "Retina."

KODAK SUPER SENSITIVE PANCHROMATIC FILM

For lightning speed. This film is $1\frac{1}{2}$ times as fast in daylight as Regular Kodak Film and three times faster in artificial light. Wherever extreme speed is required—for instance, when picture-taking after dark—this film should be used.

36 exposures for $3/6$

Lens and shutter fold safely away when camera is not in use.
Size of camera— $4\frac{1}{2}$ by 3 by $1\frac{1}{2}$ ins.
Size of picture— 36×24 mm.
(approx. $1\frac{1}{2} \times 1$ in.)

NO MORE SLIPPED MASKS

DESPITE what is said to the contrary, plates, masks and printing frames are not always cut, or made, to their exact theoretical dimensions. Hence I have always found that from time to time there is considerable trouble

experienced through masks becoming askew during printing. This applies more so when printing from films smaller than the frame employed. The question of certain and successful masking then becomes very acute.

To overcome this trouble I now make what I might call "double" masks, details of which can be seen in the accompanying sketch. The masks, as will be noted, are part of a continuous piece of paper that goes right round the negative, the masking rectangle being as usual on the emulsion side and a larger rectangle being cut at the back to prevent shadow.

By degrees I am making a collection of these masks to suit every conceivable type of picture, but in practice I find about three shapes are all that are really required.

The masks are made thus: Take the negative and sheet of smooth black paper. Lay negative on sheet and fold over two sides. Remove negative and gum these "fold-overs" together. Now make desired rectangle on the side opposite the gummed fold and with a sharp razor blade cut it out (through gummed side as well). Take scissors and cut rectangle at back (gummed fold-over side) to rather larger dimensions. Lastly, trim off ends of black paper to fit your frame exactly.

You will now have a sort of double mask in between which the plate or film will slide quite easily and remain "put" while any number of uniformly bordered prints are taken from it.

I can guarantee this mask being more than worth the few minutes it takes to make.

H. A. R.

COVER-GLASSES FROM 1/4-PLATES

THE problem of what to do with collections of quarter-plate glass, which for one reason or another were defunct negatives, used to be rather a puzzle, and doubtless it still is amongst the not inconsiderable little band who more or less tenaciously hold their own midst the vast army of film adherents.

If one makes lantern slides this problem is easily solved, for it may not have occurred to everybody that as quarter-plates measure $3\frac{1}{4}$ in. across and are usually of very thin glass, just an inch off the length would make them into excellent cover-glasses for binding with slides.

Doing this will be found very simple even to those who have never attempted glass cutting before, the only appliances required being a "wheel" glass-cutter as obtainable from the "Sixpenny Stores," and a cutting-board made from odd pieces of wood.

In making the cutting-board as shown, a smooth flat piece of wood (A) measuring about 6×5 in., forms the base, and a square block (C) with a true edge is fixed to one end. The length of board (B) serving as a guide should be about $\frac{3}{16}$ ths in. thick, and the width of a slide less half the thickness of the glass-cutter (E).

To cut cover-glasses, the gelatine films are removed from a number of negatives in hot soda water, and, after drying, a

plate is placed against the block as at (D). Then, after putting the guide in position, the glass-cutter is drawn along the edge with a firm though gentle pressure. A few slight taps on the under-side to start the crack, and a little bending will now snap the unwanted inch off cleanly.

B. T. D.

BLACK BORDERS ON PRINTS or ENLARGEMENTS

A MEANS to obviate the making of separate cards for different sizes of prints or enlargements, when a neat black border is required to be printed round them, is not difficult to operate.

Ordinarily the amateur who desires such borders feels that it is necessary to cut a separate opaque card, slightly less than the dimensions of the paper, for each size of picture he pro-

duces. By making the border in two separate stages, however, a single card can be made to serve for all sizes of print or enlargement. The sketches show the idea.

The card used should be at least a little larger than the biggest enlargement likely to be needed. The printing paper should be laid flat upon a table in the dark-room, or on the horizontal easel of a vertical enlarger. The opaque card is then laid upon the paper in such a way that a border is exposed along only two edges of the paper, as shown in sketch A.

The exposure is now made to give the necessary black border along these two edges. Then the card is moved until the remaining two edges of the paper are exposed, and the exposure again made. Sketch B shows this second stage.

No matter whether the paper is large or small, or whether a narrow or broad border is required, this method can be employed, using the same card. It is wise, however, to lay some heavy object, such as a book, upon the card during the exposure, to enable paper and card to be kept in close contact and produce a sharply-defined border.

A. N.

Music.

HOW frequently is the shadow of an object seen to be more striking and reminiscent than the actual subject. With the winter evenings and artificial lighting, this opens up a fascinating branch of still-life photography to anyone with a flair for unusual composition or effective suggestion in black and white.

Any camera is suitable. All that is required is a small, easily movable spotlight. Nothing expensive. High-power lamps and large-aperture lenses are no advantage, for all objects being stationary, any exposure may be given with safety. An ordinary house electric bulb in an old motor-car head-lamp reflector, or even in a cardboard tube with one end closed, will serve excellently as the spotlight. It is necessary, however, that the lamp can be placed at any angle, and that it will throw a definite beam of light. If a portrait flood-lamp is used, a piece of stout card should be fitted in front, with a small hole cut in the centre, about one and a half inches in diameter.

The advantages of the small controlled beam can be appreciated instantly by trying the extraordinary variety of effects to be obtained from a single object by just altering the relative position of the light and the camera. The closeness of the illumination has the advantage of giving deep, long shadows with clearly-marked edges and yet

Spotlight

By J. D. B. HAW.

retaining a brilliance of detail in the object itself otherwise unobtainable. Also, the beam deals effectively with the ever-difficult question of background; by controlling the shadows and the angle of the light all unwanted detail can easily be thrown into complete darkness.

Use a lens-hood on the camera, for most rooms are full of light-traps for reflection—pictures, fronts of book-cases, etc. Care should also be taken,

Model Dogs.

For a Golfing Friend.

in setting out the objects, to avoid surfaces such as polished tables, otherwise the edges of the shadows will be softened and slightly doubled, and flare spots from the filament of the lamp reflected in the table top may appear on the negative. A good natural-ground surface is obtained from sheets of ordinary blotting-paper.

Another useful dodge, when arranging the objects and lighting, is to have a piece of blue glass to look through when placing the subject. This shows the picture up in monochrome contrast, and, by taking away some of the detail, allows the shadows and high-lights

and Shadows

An attractive and easy form of indoor photography that can be applied to the making of novel Christmas and other greeting cards.

to be more satisfactorily composed.

A rough guide to exposure is about seven seconds at $f/8$ on S.S. panchromatic material, with lighting from one 60-watt bulb in a small reflector placed about four feet from the object. As the objects will naturally be fairly close to the camera, and few lenses have more than an inch or two depth of focus at this distance if fully opened, it will be found advisable for most subjects to use the

A Telephone Call.

Fruit Study.

$f/8$ stop, even if large apertures are obtainable. It may be necessary sometimes to use $f/11$ or smaller to obtain still greater depth of focus. The exposure will then be increased proportionately.

The illustrations herewith give an indication of the variety of effects obtainable; the subjects available are unlimited. For the production of original Christmas and other greeting cards this treatment of familiar objects can be commended, and will be appreciated as something new by the recipients. In addition to providing a pleasant form of indoor photography, it has also a definite value in teaching the amateur to seek for new viewpoints, and to produce compositions founded on shadow designs that can be altered and revised to any extent until a satisfactory result is obtained.

Enlarging can be made to do a lot towards getting an unusual or effective picture. It is surprising what

pictorial significance small, everyday objects attain when photographed in high contrast in this manner, and then a portion of them enlarged.

The best result from enlargements will be given by a matt or natural grain contrast bromide paper; for gaslight printing, Velox vigorous carbon is excellent. Avoid soft papers, as they tend to dissipate the wealth of detail required and the sharp edges of the shadows. On the other hand, glazed prints will generally give too much importance to the brilliant high-lights.

One final tip: if the negatives are developed by time and temperature, the time should be reduced by one-fifth, as the negatives will be of a very high-contrast quality. If roll films are used, it is a good idea to arrange for a batch of such subjects to be all taken on one night, so that the whole film may be exposed to similar conditions and developed accordingly.

The Architect.

How I make my EXHIBITION PICTURES

No.
CCLVI.

—
Mr.
PHILIP H.
HULBERT.

Methods and Ideals of well-known Pictorial Workers.

From information communicated to our Special Representative.

AFTER several years spent in experimenting with various cameras, concocting wonderful developers, etc., I eventually turned out prints whose chief merit was fair technical quality and good definition; and not until I joined a photographic society did I think much about the artistic aspect of photography. Six years ago I joined the Bromley Camera Club, and viewing the members' work, and that of acknowledged masters of the art who came to lecture and demonstrate, was a wonderful incentive. I realised the possibilities of pictorial photography.

"My own methods are very simple. I like to use one

camera—not half a dozen; to learn the idiosyncrasies of one's instrument takes some time. My present model is a $3\frac{1}{2} \times 2\frac{1}{2}$ folding camera, with an f/3.8 lens in Compur shutter, equipped for plates, film packs and roll films. I use the camera principally at eye-level, and my favourite material is Agfa Superpan film pack, which, in combination with an Ilford Alpha filter, gives fine tonal values and really excellent cloud rendering.

"With my roll-holder loaded with SeloChrome roll film, and a lens-hood in my pocket, I have a compact outfit with which I feel prepared for any 'shot' that may present itself, indoors or out, dull or bright, and by daylight or artificial light.

"My negatives are produced by first desensitising with B.W.'s tabloids, then developing with M.Q. developer of normal strength, using the inspection method and screened candle-light illumination. The negatives are taken to a fairly substantial density, as I cannot produce real quality from the 'ghost' variety.

"These negatives very rarely require retouching; if they do, they are usually scrapped. First I make a contact print, and if the negative is suitable for my purpose it will give a good contact print on Velox medium gaslight paper, or a lantern slide on Ilford Warm-black plate, using the recommended three-solution developer which will give various fine tones. If the negative does not pass these tests, I do not attempt to enlarge it, thereby saving myself much cash.

"My 12x10 enlargements are usually on Kodak Royal bromide or Ilford Clorona chloro-bromide, generally with a cream base, and developed strictly to maker's formula, the exposure being so arranged that development can be carried to finality. Spotting is done with water-colour for small defects, and when dry is rubbed over with the usual oil 'dope,' and any light patches treated with oily cotton-wool and a suitable pigment. Mounting is accomplished quite simply with dry-mounting tissue and a domestic electric iron.

"Regarding subjects, I thoroughly enjoy 'shooting' anything that comes along, with perhaps a preference for subjects with predominating cloud effects. A day on the downs, a north wind and cumulus clouds can be a real inspiration; or early on a sunny June morning in a Cornish fishing village, with smoke and haze floating over the harbour.

"For a change I try indoor studies, and the example shown was taken by artificial light with three seconds' exposure on Superpan material. Lighting and composition can be experimented with, and are under complete control. 'Lazy Days' was secured on SeloChrome film, exposure 1/50th sec. at f/11. I have discovered that most of my successful pictures are obtained by rapid decisions and manipulation; even so, many opportunities are lost, but the striving for the masterpiece ever 'around the corner' is one of the chief charms of picture-making."

PICTURES of the WEEK

Some Critical Comments on the Beginners' prints reproduced on the opposite page.

WHETHER there is more in negative-making than in the production of a print is a point upon which opinions will always differ. It is not easy to make a perfect technical negative, nor, once it has been made, is it any more easy to make a print that is beyond criticism, but it has to be remembered that, with the negative, it is but a means to an end, and that end is the print.

Negative and the Print.

It is the print upon which judgment is passed, and, notwithstanding anything that may have gone before, it remains the final criterion. It may be true that a perfect print cannot be produced from an indifferent negative, but it is no less a fact that an example of unfinished craftsmanship in print-making cannot do justice to the qualities a negative may possess.

A perfect negative deserves the perfect print. Too often, however, the two are not appropriately adjusted, and the print either fails to record the full range of tones in the negative, or, if they do happen to be rendered, the scale of tones is compressed within a too restricted limit. In the first case, the print seems too black and white or of too vigorous a character, and, in the second, it seems unnaturally flat. Assuming for a moment that no complications are introduced by improper technique in print-making and that there is no under-exposure of the negative, there are two factors which have to be considered in adjusting the paper to the negative, or, as it may happen, the negative to the paper.

The first is the contrast of the negative and the second the nature of the printing paper. The contrasts of a negative may vary according to the nature of the subject and the time of development. If the developing mixture be maintained at a constant strength; if the temperature be kept at the same level, or suitable adjustment made to compensate for any variation; and if the same grade and make of emulsion be always employed, negatives of similar subjects developed for the same time may be expected to have much about the same contrast

range. If the time be increased, the contrasts between extremes of tone will be greater, and if the time be decreased, the contrasts will be reduced correspondingly.

The fundamental rule, other things being equal, is that the contrasts of the negative depend upon the time of development. It will now be clear that subject differences *can* be dealt with by adjusting the time of development, providing each exposure is *separately* treated.

Theoretically, every needed adjustment could be made by this means alone, and, were it practicable, only one grade of printing paper—i.e., as far as contrast range is concerned—would be required to render all possible gradation in the negative. The qualification regarding separate treatment is essential, however, and only really feasible where each exposure is classified at once, and arrangements made for subsequent adjustment of development time for each individual case.

Where quantities are being handled, it is sometimes possible, in the case of plates, to arrange a scheme of sorting according to whether the subjects fall into high, average, or low contrast, but with roll film the required individual treatment of each exposure is scarcely feasible.

Adjustment of Contrast.

Even with plates, it is seldom convenient to sort them out when changing, and, according to modern practice, it is better to develop all the negatives for an average time and make any needed adjustment for variations in contrast by altering the grade of paper employed for printing.

In the ordinary run of exposures, the subjects do not vary to such an extent as to make such an adjustment impossible.

Most types of paper are made in three different grades—soft, normal and vigorous. There is the gaslight group, which, as a class, is fairly vigorous and suitable for lightly developed negatives; there is the bromide class, which, on the whole, is softer than gaslight; and softer still is the group of papers known as chloro-bromide.

Types of Printing Paper.

Each of these groups is sub-divided, as already indicated, into three grades, and, if it could be assumed that the six prints on the opposite page were printed from negatives from the same roll of film—all having received the same degree of development—an idea of the resulting contrast differences which might be expected if the same grade of paper were used in each case may be gathered.

No. 6, "By Falling Foss," by J. C. L. Way, is just a shade on the flat side, but all the tones are fully recorded. The lighter values have just the touches of gradation they need, but the darks are not quite so strong as they might be. If it be assumed that the grade of paper known as normal has been employed throughout, the paper that is required to give the extra depth in the darks without losing the gradation in the lights is the grade called vigorous.

Nos. 1 and 2, "High and Dry," by J. Hamilton, and "Brig o' Balgowrie," by J. M. Veitch, could be regarded as being very well matched, though, in each case, there is scarcely sufficient tone in the sky. This, however, is more a matter of colour rendering than adjusting the paper to the negative, and, possibly, the occasion will arise in the future for this aspect of the question to be discussed. Somewhat similar remarks are applicable, also, to No. 4, "Conway Castle," by Herbert Duff. Here, however, there is just a tendency for the contrast of the paper to be inadequate to render all the tones of the negative, and an improvement might be expected if a paper of softer characteristics were substituted.

In No. 3, "Swirling Waters," by Miss M. G. Ann, the tendency is much more evident, the lighter passages being practically devoid of any hint of tonal differentiation, a defect which, again, makes its presence felt in No. 5, "Stepping Stones," by Miss D. Croxson. In both these latter cases a softer grade of paper is very definitely called for, and in all probability that will not go far enough, and it may be necessary to utilise an extra soft type or go on to another group. "MENTOR."

Pictorial Analysis

Every week one of the pictures reproduced on an art page will be analysed in detail for the benefit of readers of the paper who are seeking to improve their pictorial work.

"FESTIVAL EVE," by Harold Cazneaux.

WHEN the number of figures included in this picture is considered, and having regard to their age and liability to sudden or spontaneous movement; the difficulty of arranging three or four in a satisfactory group, to say nothing of nearly a dozen; and the entire absence of any feature to indicate deliberate posing, it can readily be admitted that it represents something in the nature of a decided achievement.

Quantity and Quality.

The chief difficulties in this class of work, apart from any question of arrangement or artistic quality, are the avoidance of both movement and camera consciousness, while the matter of exposure and development of the negative call for special treatment on account of the high degree of contrast in the subject itself.

As will have been gathered from the remarks on the preceding page, it would have been found desirable to reduce the negative contrasts by curtailing the time of development, and, if then found necessary, to counteract any remaining tendency towards excessive contrast by the choice of a printing paper of soft characteristics. It is possible, of course, that the whole adjustment took place during one of the two operations—either development of the negative or choice of printing paper—but, in the absence of any technical data, no confirmation is available. However, it is far more likely, having regard to the long experience behind the work, that what adjustment there was was made during both, particularly as the range of the subject contrast would be known from the outset.

The main thing, of course, is that the necessary adjustment should be made, and that it has been successfully accomplished is convincingly demon-

strated by the undeniable harmony of the tonal values.

Technical Treatment.

The same harmony also affords an indication of an excellent judgment of the exposure required, as well as of sound technical treatment throughout. To this, again, the quality in the print also bears witness, and, although the exposure could not have been severely cut down, it represents a very nice

light notes of collar and sleeve. It would, almost certainly, be overlooked by nine viewers out of ten, and the tenth, no doubt, could be regarded as hypercritical. At any rate, it does not affect the pictorial appeal of the work, and, considering the number of figures included, it is really a wonder that there is no more.

Keeping the same factor in mind, the arrangement, with its double pyramidal form, is excellently managed.

How far it was controlled, or if occurring entirely by chance, history does not relate, but its spontaneity is remarkable, and it is on this quality that much of the success of the work depends. The absence of camera consciousness contributes not a little towards the suggestion of spontaneity and, from this, it may perhaps be legitimate to infer that the subjects were unaware of being taken. If so, and the picture relies solely for its being upon the choice of time for making the exposure, the achievement is all the greater and the patience exercised must have been remarkable.

Noteworthy Points.

A further attractive feature is to be found in the imitation suggested by the similar attitudes—in reverse—of the figure in chief (1) and the one on the extreme right (2).

Because they face each other, the attention is held within the picture, and whatever is outside these two points cannot claim any particular notice. They seem to centralise the interest, and, incidentally, the arrangement of the domestic pots and pans seems peculiarly happy. It might even be the case that one or two still-life studies of considerable appeal might be made from the same negative, and, if so, Cazneaux would not be the first pictorialist to get two or more exhibition prints from the same negative!

"MENTOR."

degree of judgment between the amount that ought to be given and that to which, on account of the possibility of subject movement, it should be limited.

Aided by a very exact sense of the psychological moment for making the exposure, however, there is nothing but the slightest hint of subject movement anywhere in the picture. Even then, it is only barely discernible, and, ironically enough, occurs in the proximity of the head of the figure in chief (1). It would be more noticeable, perhaps, if the subject were enlarged to a greater degree, but, in the present print, is only detectible by a slight indecision in the lines of the profile, eye, and the

NOTES & NOTIONS
for the
LESS ADVANCED
WORKER

Every week an article will appear under this heading dealing with a topic of interest to the novice in photography.

PHOTOGRAPHS AT HOME.

IT is not everyone with a camera who fully realises how useful it may often be at home. It is regarded as something to be got out for use on excursions and holidays, but is liable to be overlooked altogether for purposes it may well serve in the home and garden.

The most likely occasions on which it may be remembered and used are those which provide an opportunity of taking portraits, generally out of doors. Probably this is, on the whole, the best and most popular use to which the camera can be put at home, especially when a garden of some sort is available. Much excellent work has been done in this way, and in many cases the results are not only good portraits or "likenesses," but pictures with a more general appeal by reason of effective lighting, sound composition, and good technical and pictorial quality. Children especially provide fine subjects.

Next in popularity come snapshots of animal life—dogs, cats, birds and other home pets; and very successful in every way they may be when handled with experience and skill. Also there may be secured attractive "garden" subjects, general views, selected corners, the fountain or sundial in fortunate cases; and often figures may be introduced, not for "likeness"

Fig. 1.

purposes, but to add a subordinate note of human interest. Flowers may be photographed in the mass, or as separate isolated subjects, and this branch of work is often done indoors as well as out.

At least one distinguished photographer has compiled fascinating lantern lectures, with all the subjects secured within the boundaries of his own garden, and many of the subjects made more realistic and beautiful by slides which have been coloured by hand, or produced by one of the natural-colour processes. But it is only the fortunate few whose gardens lend themselves to such ambitious schemes.

There is the same difference in interiors. It is only a comparatively small number of homes that lend themselves to effective interior views and vistas, or provide attractive corners and "bits," with or without figures as in the case of the garden subjects.

But even the humblest of us can find subjects to photograph at home, even if they are nothing more than imported fruit and flowers. In illustrating these beginners' notes I have often resorted to something handy indoors which has answered the purpose in view.

Fig. 2.

Fig. 1 was not taken to illustrate any technical point, but just as a record. In the corner of a very small and unpretentious garden plot, innocent of such adornments as fountains, sundials, pergolas and rock gardens, was a casual slip of grape vine which filled an odd corner with foliage, and even displayed ragged bunches of small green grapes.

Owing to the wonderful summer this year the bunches were not only larger and more numerous, but the grapes turned purple and ripened, and there were many bunches which weighed well over a pound each. So one morning at breakfast time I got out a quarter-plate reflex, and, perched precariously on a chair, took a few snaps to provide evidence of the phenomenal success of the "vineyard."

A couple of evenings ago I wanted a photograph of the carved panel shown in Fig. 2—the familiar crude Indian carving in low relief. I simply propped it upright under a 60-watt electric bulb, and moved it about till the contrasts were very strong, and exposed and developed so as to exaggerate the contrasts as much as possible. Two minutes' exposure at $f/11$ on a Wellington anti-screen plate gave what I wanted.

As I have before pointed out, it is in such cases that records of distance, light, subject and exposure have a practical value. For example, having got an idea of the exposure at a given distance from this particular lamp I can get some guidance for exposure at a different distance by comparing the squares of those distances. Suppose that I know the exposure at 2 ft., and wanted to know it at 6 ft., I should square 2 and 6, and the numbers 4 and 36

would show at once that the exposure would have to be nine times as long. Similarly I could allow for the use of a different stop, plate, subject and character of the result required. Having taken everything into account, and arrived at an exposure which seemed "right," I should almost certainly double it to make it "righter."

Some of the things I have suggested for dealing with at home can be dealt with in the usual "snapshot" manner, but there are others which cannot be adequately tackled with, say, a small roll-film camera. In many cases a stand camera with a focussing screen is indispensable, and a long extension advisable. Many beginners will retort that they have only one camera, and it is not adapted for such work. To such I would seriously suggest getting another camera, which would be handy not only at home but elsewhere.

It need cost very little. Amongst my apparatus I have a quarter-plate camera, of well-known British make, with single slides (3) for plates; Aplanat $f/8$ lens in three-speed B. and T. shutter, focussing screen and scale, finder, rising and cross front both ways; and the whole cost ten shillings. It would have been better with double extension, and it would have been easy to find one with this addition for a trifling extra cost. Such cameras are easily picked up at prices which make them worth getting, if only for occasional use.

As a rule it is possible, when working at home, to expose a single plate, develop it forthwith, and have another shot if necessary.

W. L. F. W.

Letters to the Editor

The Editor is not responsible for the opinions of his correspondents.

D. AND P.

SIR,—The letter from your correspondent W. H. Lewis, headed "D. and P.," prompts me to reply that, having control of a fairly extensive dept. dealing with developing and printing of amateurs' films, I have yet to find a film clip that will damage any film that has been properly loaded and checked off, either by the number in the window or the mechanical methods now in vogue. It is, or should be, common knowledge that all manufacturers provide ample spare film at each end of the roll for clips or even hand development.

I have handled films which have been damaged by the clip, but only when the "spacing" has been irregular and the last exposure made on the "dead end" of the roll. Perhaps your correspondent knows of some method of predetermining where the image is going to appear, or has some dark scheme of invisible clips. If I am not taking up too much of your valuable space I would suggest your correspondent invests in one of the many varieties of developing tanks on the market instead of driving further nails into the proverbial coffin of the wicked professional who seems to exist to destroy, rather than develop, his business.—Yours, etc., H. SIMONS.

SPEED NUMBERS.

SIR,—A frequent query in "Readers' Questions" is for a formula to convert degrees Scheiner to H. & D. As you point out, this cannot be done, but as I imagine most of these queries come from readers who possess exposure meters calibrated in degrees Scheiner only, the reply must be disappointing. The following table, which is worked out in round figures, is reasonably accurate, and may be of service to those who use foreign exposure meters. Plate users who stick to the plates rated as "ordinary," "rapid" and "extra rapid," will find that 12° , 14° and 16° will be approximately correct.

| H. & D. Scheiner. | H. & D. Scheiner. | H. & D. Scheiner. |
|-------------------|-------------------|-------------------|
| 250 | 16° | 650 |
| 300 | 17° | 800 |
| 400 | 18° | 1000 |
| 500 | 19° | 1300 |

—Yours, etc.,

H. BRAITHWAITE.

DEVELOPING TANKS.

SIR,—I should like to express my thanks to those who in your issue of the 17th October have suggested various means of preventing films from adhering to the aprons of developing tanks. Perhaps I should have said in my original letter that I have neglected none of the elementary precautions which they advocate. Had it been otherwise I should not have presumed to write to you on the subject.

I have since consulted several dealers, who assure me that the trouble which I have experienced is by no means uncommon in the case of panchromatic films, which I invariably use. One of them suggested that it was due to the sticky nature of the backing usually applied to such films. This explanation leaves me unsatisfied, since, as your correspondents point out, the emulsion ought never to come into contact with the apron if the apparatus is properly handled. I have nevertheless ruined many spools.

It is some comfort to know that I am not alone in my trouble, but, like Mr. Longfield, I have still to discover the perfect developing tank for panchromatic films.—Yours, etc.,

J. A. STIRLING.

SIR,—Some years ago I had similar trouble to that of your correspondent. I completely got over it by damping the apron. By this means the film when rolled into the apron adheres to it. I can never understand why the Kodak people emphasise the necessity for the apron being quite dry; since using it damp I have never had the slightest trouble.—Yours, etc.,

HAROLD BAYLEY.

ANASTIGMAT LENS.

SIR,—Although not a lens manufacturer I should like to comment upon the remarks of Mr. B. C. Hamilton in the issue dated November 7th.

Even if the corner of the wall in question is seven feet away from the lens, the plane of the wall remains always six feet from the plane of the lens. If the camera is focussed on a point six feet away, then everything lying in a plane through this point (which plane is parallel to the plane of the lens) will be in focus. This can be understood more easily when one considers that if the centre of the plate is six inches from the lens, then the corner of the plate will be seven inches from the lens; and it is upon this corner that the image of the wall corner is formed.—Yours, etc.,

K. M. BEVINS.

Amateur Cinematography

NEWS, NOTES AND MATTERS OF INTEREST FOR ALL CINEMATOGRAPHERS USING AMATEUR CINÉ APPARATUS.

The Fun of Film Editing By M. A. LOVELL-BURGESS.

THE editing of films should form an engrossing part of the amateur cinematographer's winter programme. It is hard to sacrifice shots that took perhaps hours to locate, but the true artist, like the writer, experiences joy in finding exact expression. And there is, of course, more to editing than mere cutting. It is the film editor who can give precise sequence and continuity.

Editing presupposes a knowledge of splicing, or joining. There are many aids to good splicing on the market, and it is for the amateur himself to note the limits of the frame marking, to scrape emulsion off cleanly, and not to use too much, or too little, cement.

Sub-titles come into the category of editing. "Skilful titling can make even a dull film seem quite good," said Mr. A. S. Chard, of Cinécraft, in a talk on titling to members of the Eastbourne Amateur Ciné Enthusiasts' Club recently. Mr. Chard demonstrated the various methods of making titles, including trick titles, and said that the very worst amateur film which he had ever come across—in the course of which the camera had actually become reversed at one point—had been transformed by clever editing, and some amusing titles, into one of the wittiest and brightest productions he had ever seen.

If up till now you have been content to take your films, project them, and leave it at that, you have only known half the thrills of amateur cinematography. There is nothing like personal experience of film editing in all its aspects to make one cinema-minded.

Don't let the winter pass, however, without at least one record of a mood characteristic of the season. The sea never shows its beauty and strength so well as in winter. And one morning you will wake up and find your corner of the world white with snow. Have your ciné camera ready. There are winter sports even in England. Hunting has its own pageantry. Trees never have more "character" than when in winter they take on a new architectural beauty. Note how each tree has its own way of holding its

boughs, and take advantage of the interplay of light and shade.

Recently I was asked, "Is it possible for a ciné amateur to make a nature film similar to the 'Secrets of Nature' series?" Certainly it is possible with micro-cinematography and patience, and much can be done with an ordinary ciné camera and a telephoto lens. We all admire cinematographers who wrest the secrets of far-off jungles for our delight. But why is it we do not go after nature as ruthlessly with our ciné camera in our own English woods; follow the dormouse to his winter nest in the hedgerow, and the red squirrel, as he goes about his work of storing nuts in the hollow of the tree trunk; film the flocks of birds arriving now on our shores from Iceland, Lapland and Russia, or the gulls driven inland before approaching storms and gales? Why not a film of how the otter and badger, the

hedgehog and harvest mouse, the squirrel and the bees prepare for winter? Few people know of their careful preparations, and hardly believe it if you tell them, but "seeing is believing."

Parks offer plenty of good winter subjects. Only frost and ice, for instance, keep the children from sailing their yachts on the Round Pond in Kensington Gardens. The rain is the sole enemy of the regiment of nursemaids. There is plenty of spirited riding in the Row on crisp, cold mornings, and you can generally get a good shot of people feeding gulls by the little bridge that spans the Serpentine.

What contrasts are offered your ciné camera, from the "Chocolate Lady"—some of you may have heard her in the radio feature, "In Town To-night"—whose "pitch" is by Kensington Palace, to the sophisticated Mayfair ladies parading with their

Autumn Leaves in the Park. For the amateur cinematographer in search of seasonal subjects, the parks now offer many opportunities for picture-making.

coat-clad dogs. Even cold weather doesn't keep out the boy and girl lovers, and there always seem to be footballers in the adjacent playing-fields in the afternoon.

Such a characteristic stretch of London you have, from the orators

with their democratic groups of listeners, many of them unemployed, at the Marble Arch entrance to Hyde Park, right across to the much-maligned Albert Memorial—that pageant in stone of England's greatness—and to Kensington Palace, with its wide

approaching avenues, and its picturesque sunken gardens where Queen Victoria walked in her teens.

What fun it would be editing just such a film as this, with always the green background for sequence and continuity!

Ciné Club Activities

INDEPENDENT Film Makers are in need of a room situated in central London where members could meet any night of the week for discussions and refreshments. Until now members have been meeting at a restaurant in Leicester Square on Monday evenings.

"If any member knows of such a place," writes Leslie Beisiegel, in the current I.F.M.A. bulletin, "will he or she write to me, when I will bestow upon them my blessings, because my digestion is being ruined by sampling the foods of cafés, dives and restaurants that look as if they would stand the intellectual forces of I.F.M.A."

The Liverpool Amateur Film Society is arranging an exhibition of amateur films to take place this month in their private theatre. An appeal is being made for the loan of films to be shown in conjunction with

their own productions. Offers of films on loan would be gratefully received by the Hon. Secretary, Mr. D. M. Furlong, 141, Wood Street, Liverpool, 1.

A series of lectures and demonstrations are enlivening the winter months for members of the Ciné Section of the Portsmouth Camera Club, whose headquarters are at 54, Hyde Park Road. Instruction is given in developing, printing and titling, as well as in camera work and projecting. A 300-ft. film is being made, and it affords ample opportunities for all aspects of ciné work. Enquiries concerning the Club should be made to Mr. C. Worley, 9, Arundel Street, Portsmouth.

Mr. E. Lightfoot, of the Dorset Film Society, writes, "The reason of the greatness of the Soviet Directors is that funds were so low they could

not afford to shoot, so they had to theorise, and think. Funds, etc., are at a low ebb with our club so we may be brilliant one day—perhaps."

Or, as Shakespeare would have said, "And some have greatness thrust upon them!"

Wimbledon's fourth annual ciné dance will take place on December 1st. Weekly meetings are held at the Wimbledon Ciné Club, and a new film production is being started. Particulars may be obtained from Mr. C. W. Watkins, 79, Mostyn Road, Merton Park, S.W.19.

Amateur cinematographers interested in the making of religious films will be glad to know that "Mastership," the religious 16-mm. talkie, featuring "Lax of Poplar," was shown at the Walham Green Methodist Church, Fulham, on Sunday, November 4th, after the evening service.

NEWS AND REVIEWS

ITEMS OF GENERAL INTEREST FROM ALL QUARTERS.

We hear from Studio Briggs that they have secured the services of Mr. Noel Griggs as Studio Director. Mr. Griggs' fine technical and pictorial work is already known to our readers, and his exhibits at the recent P.P.A. exhibition of technical and commercial photography included some of the best work in the show.

The L.M.S. Railway are to exploit Britain's scenic splendours, and interesting aspects of railway activities, by means of sub-standard (16-mm.) films during the forthcoming winter lecture season. Throughout the summer, L.M.S. staff operators have been busy in North Wales, Scotland, the Lakes and other holiday districts, with the result that nine purely scenic films have been made. In addition, four films are available depicting interesting railway activities, such as the building of a railway coach; the American tour of the Royal Scot; passenger trains; and railway steamship services. Four districts—London, Birmingham, Manchester and Glasgow—have been equipped with projectors, and the films will be loaned to institutes, clubs, etc., an experienced commentator being provided if required. This new films scheme is distinct from that which

the L.M.S. Railway already have successfully in operation for the exhibition at various centres on the system of educational and interest films to the staff themselves. Full particulars regarding the loan of these films will be sent on application to the Press Section, L.M.S. Railway, Euston Station, N.W.1.

At a recent "At Home" of the 5/7th Battalion the Hampshire Regiment at Bournemouth, one of the most interesting events of the evening was a projection of a Dufaycolor film showing the Battalion annual training in camp at Seaford. This was made, at his own expense, by Mr. J. P. J. Chapman, and a ten-feet wide picture was projected from the 16-mm. Dufaycolor film. We believe that this is the first time that a substandard colour picture has been shown to such a large size.

"Audivision" Films. An American correspondent tells us of "audivision" films that are now becoming popular in the States. They are lantern lectures brought up to date. Instead of bulky glass slides, the pictures are printed on standard 35-mm. cinema film; 100 "slides" are printed on a roll an inch in diameter. The film is shown by

means of a small 200-watt projector; it is run through by hand, one frame at a time. Instead of a human lecturer, the sound part is put on a 16-in. record (33 r.p.m.). This enables the producer to depart from a straight lecture and dramatise episodes, put in music, or whatever is wanted. As soon as the comments are finished regarding each picture (fifteen or twenty seconds) a bell or gong is rung, which sound is recorded and is the signal to change the frame. The outfit is entirely portable and is used for educational or industrial purposes, such as sales organisations, sales promotion, etc.

The Members' Exhibition of the Camera Club was opened this week at 17, John Street, Adelphi, W.C.2. Mr. James Smith, Art Editor of the *Daily Telegraph*, acted as judge. The exhibition remains open until December 17th, and will then be followed by the exhibition of Original Pictures from *Photograms of the Year, 1934-35*. Admission is free.

Ilford, Ltd. advise us that they are now able to supply infra-red roll films in all the popular sizes and at reasonable prices; the No. 20 (2½×3½), for instance, being 2s. 3d. per spool. The infra-red film can also be supplied for Leica cameras for thirty-six exposures at 6s. per spool. All other sizes can be supplied to order.

The Week's Meetings

Societies will have their meetings announced here if the syllabus is sent to us at the beginning of the session or from time to time.

Thursday, November 22nd.

Accrington C.C. "Flashlight Photography." Johnson & Sons, Ltd.
Ashton-under-Lyne P.S. L. and C.P.U. Slides.
Aston P.S. "Matters Photographic."
Bath and County C.C. Intensifying and Reduction.
Burv P.S. "The North Lancashire Border." G. A. Forman.
Coatbridge P.A. G.D.U. and S.P.F. Portfolios.

Exhibitions and Competitions

CURRENT AND FUTURE.

Notices of forthcoming exhibitions and competitions will be included here every week if particulars are sent by the responsible organisers.

The Amateur Photographer Monthly Competitions for Beginners, Intermediate and Advanced Workers.—Entries, November 30. Rules in the issue of October 31.

Photographic Society of Ireland, Members' Annual Exhibition.—Open, November 26–December 1. Secretary, A. V. Henry, 34, Lower Beechwood Avenue, Ranelagh, Dublin.

Chicago International Salon.—Open, December 13–January 20. Entry forms from Salon Committee, Chicago Camera Club, 137, N. Wabash Avenue, Chicago, Ill., U.S.A.

"Northern" Exhibition, City Art Gallery, Manchester.—Open, December 8–January 19. Secretary, J. Chapman, 25, Radstock Road, Stretford, Manchester.

Western International Salon.—Open, December 10–15. Organising Secretary, W. H. Hill-Muchamore, 24, Church Road, Redfield, Bristol, 5.

8th International Christmas Salon of Photography, Antwerp, 1934–35.—Open, December 23, 1934–January 7, 1935; entries, November 15. Particulars

and entry forms from Mr. J. Van Dyck, Secretary of the Fotografische Kring "Iris," Ballaerstr., 69, Antwerp, Belgium.

Madrid International Salon.—Entries, December 10. Particulars from the Secretary, Sociedad Fotográfica de Madrid, Calle del Principe, 16, Madrid, Spain.

Preston Scientific Society (Photographic Section). Open Exhibition.—Entry forms due January 11; exhibits, January 17; open, January 28–February 16. Secretary, F. Wells, 65, Powis Road, Ashton, Preston, Lancs.

South London P.S. Annual Exhibition.—Entries, January 22; open, February 16–March 16. Details and entry forms from Hon. Exhibition Secretary, H. S. Adams, 40, Stockwell Park Road, S.W.9.

Leicester and Leicestershire Photographic Society International Exhibition.—Open, February 25–March 2, inclusive. Particulars and entry forms from the Hon. Organising Secretary, W. N. Plant, 30, Harrow Road, Leicester.

Ilford P.S. Annual Exhibition.—Entries, February

2; open, March 4–9. Hon. Exhibition Secretary, H. G. Haylock, 58, Windermere Gardens, Redbridge Lane, Ilford, Essex.

Birmingham P.S. Annual Exhibition.—Entry forms due, February 9; exhibits, February 12; open, March 2–16. Secretary, E. H. Bellamy, Waterloo House, 20, Waterloo Street, Birmingham.

City of London and Cripplegate P.S. Annual Exhibition.—Closing date, February 11; open, March 11–16. Exhibition Secretary, J. R. P. Hilliard, 86, Downton Avenue, Streatham Hill, S.W.2.

Barry C.C. International Salon.—Entries, March 8; open, March 18–23. Secretary, J. H. White, Caerleon, 61, Pontypridd Road, Barry, Glam.

Scottish National Salon (Art Galleries, Avr).—Entries, Overseas, March 9; Great Britain, March 23; open, April 20–May 4. Secretary, Arthur J. Nelson, 6, Hilary Crescent, Avr, Scotland.

Brussels International Salon.—Entries, March 15; open, May 7–June 9. Secretary, M. Maurice Broquet, Rue du Sceptre, 77, Brussels, Belgium.

Readers' Questions ANSWERED

GENERAL.—All communications for the Editor should be addressed: "The Editor, *The Amateur Photographer and Cinematographer*, Dorset House, Stamford Street, London, S.E.1," and in every case, without exception, must give the name and address of the writer.

CONTRIBUTIONS.—The Editor is glad to consider original, up-to-date manuscripts on photographic subjects. All contributions must be typewritten, or in very legible handwriting on one side of the paper only. Letters or communications arising out of matters already appearing in the paper are not paid for. The Editor disclaims legal responsibility for the safety of matter submitted to him, but he will endeavour to return rejected manuscripts, etc., when a stamped addressed envelope is enclosed. MSS. or prints that are not actually accompanied by a stamped wrapper or envelope can in no case be returned. Reproduction fees for prints are only paid by arrangement beforehand. The sending of a print, without any condition stated, will be taken as permission to reproduce it without fee.

ENQUIRIES AND CRITICISM.—Advice, Criticism and Information are freely given, but the following conditions should be read carefully before applying, as any communication which does not comply with the rules must be ignored.

(1) See "General" above. (2) Every question and every print for criticism must be sent separately through the post, and must be accompanied by a separate stamped addressed envelope. No exception can be made in any case to this rule, except so far as enquiries or prints from Overseas are concerned. (3) Neither enquiries nor prints for criticism must be enclosed with competition prints. (4) On the back of each print sent for criticism, in addition to the name and address of the sender, must be the title (if any), and the criticism coupon from the current issue. (5) Enquiries should be clearly written, on one side of the paper only, and should be specific and not general. Such enquiries as "How can I take interiors?" or "Can you give me some hints on outdoor portraiture?" are too general to be dealt with in this section. (6) All envelopes should be distinctly marked "Query" or "Criticism," as the case may be. (7) Prints are sent for advice or criticism on the distinct understanding that by so doing permission is given for their reproduction without fee. We endeavour to deal promptly with enquiries, but cannot undertake to answer by return of post, nor can we give precedence to any enquiry.

A selection of those replies is printed each week, but all questions are answered by post. Enquiries from abroad must contain a coupon also, but it need not be from the current number, and should be cut from the latest issue to reach the enquirer.

Night Photographs.

What is the best developer to use for night photography?
G. A. D. (Parsons Green.)

As a rule it is advisable to use a rather soft-working developer for night effects, such as metol or one of the proprietary developers like Azol. With these developers the detail comes up quickly, but it takes some time for great contrast to be built up; and it is only necessary to stop development at the right point before the greater densities have become too marked.

Copyright.

Should I be infringing copyright if I make lantern slides (not for sale) from pictures, etc., in text-books, magazines and post cards?
A. E. J. (Bingley.)

Legally speaking, you infringe copyright by the mere act of copying, and when it comes to copying from magazines and post cards you will probably be running considerable risk. The purposes for which you are using the slides, and the fact that you will make no charge for showing them, has no effect whatever according to copyright law. We can only suggest that where names of publishers are available you should ask for permission to do what you require, and in all other cases you refrain from doing anything of the sort.

Coloured Prints.

Could you inform me if there is any commercial value for tinted snapshots similar to the enclosed?
H. V. S. (Southsea.)

We do not know of any place where you could find a market for tinted photographs. These hand-tinted prints, generally post cards, are sometimes offered for sale, but at very low prices, the work in that case being turned out in large quantities by a kind of mass-production method.

Hand-stand Camera.

Is there a hand-stand camera that can be used in the hand and on a tripod as well?
W. C. M. (Maryport.)

The majority of ordinary hand-cameras are capable of being screwed on to a tripod, when they become in a sense stand-cameras. At the same time, the term "hand-stand" is usually applied to a camera which has some of the movements of an ordinary field camera that are not generally found on hand-cameras. It would be safe to say, for example, that a hand-stand camera has a focussing screen, which many hand-cameras have not.

Blue Prints.

Is there a satisfactory method of using blue-print paper so that the colour is black instead of blue?
J. M. T. (Alloa.)

There is no really satisfactory method of doing what you require with the blue prints. The nearest approach to getting what you desire is to soak the blue prints for a few minutes in 5 per cent potassium carbonate solution; then wash and immerse in a 5 per cent tannin solution, after which the prints must be again washed.

Lantern Lectures.

Could you let me know the names and addresses of firms that supply lantern and other lectures suitable for a photographic society?
J. K. F. (Croydon.)

Some considerable time ago we published a list of lectures available from different firms and so on, but it would be much too long to repeat. Far and away your best plan would be to join the Alliance of photographic societies in connection with the Royal Photographic Society, 35, Russell Square, London, W.C.1. The subscription is only £1 rs. per annum, and you would have placed at your disposal a great variety of lectures, portfolios and so on.

Flat Enlargements.

Enclosed is a sample of the flat, dull enlargements I get, although the negatives give good prints on normal Velox. Could you help me to improve them?
W. J. M. (Shrewsbury.)

If, as you say, this negative gives a good print on normal Velox we can only think of two reasons for the dull, flat appearance of the enlargement. One is that the paper is too soft in character, and should be more vigorous; and the other is that you seriously over-exposed.

Colour Prints.

Is there any amateur method available for making prints in natural colours? If so, what firm supplies the materials?
A. C. (Uxbridge.)

Practically the only satisfactory process of making colour prints is the three-colour carbon or Carbro process, but these are rather difficult and complicated, and involve in each case the making of three different negatives. Full particulars of both can be obtained from the Auto-type Company, Ltd., 59, New Oxford Street, London, W.C.1.

Marking Bromide Paper.

I find difficulty in deciding the sensitive surface of matt bromide paper, as the curling of the paper is uncertain. Can you tell me of a chemical that will make a distinctive mark on the unexposed sensitive surface?
G. B. S. (London.)

We cannot suggest any chemical that will at once make a mark on the unexposed surface of bromide paper. If you put the extreme corner of a sheet between slightly moistened lips you will find that the sensitive side distinctly adheres.

Canal Subjects.

Will you tell me some suitable places in London where I can obtain photographs of canal barge life?
R. S. T. (Lowestoft.)

We cannot state any definite parts of London where you can obtain canal photographs. Some of the best examples of this type of work are to be obtained outside London itself, and require a good deal of patience and experience to secure.

Water Development.

With reference to the dodge of partly developing in plain water, can you tell me where I could find time and temperature tables for this method?
H. E. H. (London.)

No definite times can be laid down when the plain water dodge is resorted to. The whole method has to be conducted by actual observation, and variation in times must be made according to circumstances.

Night Photographs.

I would like to take night photographs like the sample herewith, but doubt if my camera is suitable. Can you tell me the maximum f/number, the type of film, and the approximate exposure?
W. E. F. (Clifton.)

Almost any camera is suitable for night photography, provided you do not attempt to include figures. This demands a very large aperture lens and the fastest films available. Exposures may vary, according to subject and circumstances, from about one second to half an hour, or even more. You will find some useful information on exposures for night subjects in the Burroughs Wellcome Diary.

The new volume of "Photograms of the Year" for 1935 now in the press, to be published early in December, reflects the wide range of subjects which the present-day photographer brings within the scope of his art. Every lover of charming pictures should make sure of obtaining a copy of this collection of masterpieces from the world's foremost camera artists.

Orders in advance with remittance should be forwarded to the Publishers

ILIFFE & SONS LTD., DORSET HOUSE, STAMFORD STREET, LONDON, S.E.1

READY EARLY IN DECEMBER

Business Notices

Publishing

OFFICES.—Dorset House, Stamford Street, London, S.E.1. Telegrams: "Amaphot, Watloo, London." Telephone: Hop 3333 (50 lines).
PUBLISHING DATE.—"The Amateur Photographer and Cinematographer" is on sale throughout the United Kingdom every Wednesday morning.
SUBSCRIPTION RATES.—British Isles 17/4 per annum, Canada 17/4, other countries abroad 19/6 per annum, post free.
REMITTANCES.—Cheques, etc., should be crossed and made payable to Iliffe and Sons Ltd.

Displayed Advertisements

Communications on Advertisement matters should be addressed: The Advertisement Manager, "The Amateur Photographer and Cinematographer," Dorset House, Stamford Street, London, S.E.1. Copy for displayed advertisements for the issue of any particular week must reach Dorset House by the first post on Tuesday morning in the week previous. Rates and conditions will be sent upon application.

Prepaid Advertisements

SALE AND EXCHANGE: AMATEURS ONLY—
 12 words or less 1/-
 1d. for every additional word.
PROFESSIONAL AND TRADE—
 12 words or less 2/6
 2d. for every additional word.

Each paragraph is charged separately
SERIES DISCOUNTS are allowed to Trade Advertisers as follows on orders for consecutive insertions, provided a contract is placed in advance, and in the absence of fresh instructions the entire "copy" is repeated from the previous issue: 13 consecutive insertions, 5%; 26 consecutive, 10%; 52 consecutive, 15%.
 All advertisements inserted in these columns must be strictly prepaid and posted to arrive at the Head Office, Dorset House, Stamford Street, S.E.1, not later than first post FRIDAY for the following week's issue, or one day earlier at the Branch Offices, 19, Hertford Street, Coventry; Guildhall Buildings, Navigation Street, Birmingham, 2; 260, Deansgate, Manchester, 2; 28a, Renfield Street, Glasgow, C.2.
 Advertisements are inserted, as far as possible, in the order received, and those received too late for one issue, or crowded out, are published in the first following in which there is space. The Proprietors retain the right to refuse or withdraw advertisements at their discretion.

Postal Orders sent in payment for Advertisements should be made payable to **ILIFFE AND SONS LTD.**, and crossed
Notes being untraceable if lost in transit should not be sent as remittances.

& Co

The Proprietors are not responsible for clerical or printer's errors, although every care is taken to avoid mistakes.
BOX NUMBERS.—For the convenience of advertisers, letters may be addressed to numbers at the office of this paper. When this is desired, the sum of 6d. to defray the cost of registration and to cover postage on replies must be added to the advertisement charges, which must include the words "Box 000, c/o 'The Amateur Photographer'." Replies should be addressed: "Box 000, c/o 'The Amateur Photographer,' Dorset House, Stamford Street, London, S.E.1," and these letters will be simply forwarded by us to the advertiser. It must be understood that we do not deal with the correspondence in any other way, nor accept any responsibility in connection with the advertisement. Readers who reply to Box No. advertisements are warned against sending remittances through the post, except in registered envelopes. In all such cases the use of the "Deposit System" is recommended.

Special Note

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post. When sending remittances direct to an advertiser, stamp for return should also be included for use in the event of the application proving unsuccessful.

Deposit System

Readers who hesitate to send money to advertisers in these columns may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Amateur Photographer and Cinematographer," both parties are advised of its receipt. The time allowed for decision is three days, counting from receipt of goods, after which period, if buyer decides not to retain goods, they must be returned to sender. If a sale is effected, buyer instructs us to remit amount to seller, but if not, seller instructs us to return amount to depositor. Carriage is paid by the buyer, but in the event of no sale, and subject to there being no different arrangement between buyer and seller, each pays carriage one way. The seller takes the risk of loss or damage in transit, for which we take no responsibility. For all transactions up to £10 a deposit fee of 1/- is charged; on transactions over £10 and under £50 the fee is 2/6; over £50 and under £75, 5/-; over £75 and under £100, 7/5; and on all transactions over £100, one-half per cent. All deposit matters are dealt with at Dorset House, Stamford Street, London, S.E.1, and cheques and money orders should be made payable to Iliffe and Sons Ltd.

CAMERAS AND LENSES

STUDIO Camera 12×10, Portrait lens, blind shutter, 12×10 slide, 2 whole-plate for same, studio stand, 30/-; 700 P.C. Films of foreign places, all named.—Ianson, Wellington St., Ripon. [4491]

WARNING

We have received many complaints from our readers in regard to the business methods of Mr. R. L. Green, trading as R. L. Green's Photographic Exchange, of 218, Fore Street, Edmonton, London, N.18.

For some considerable time we have refused to insert his advertisements in "The Amateur Photographer and Cinematographer," and from the complaints we have received it would appear that his practice is to communicate with private advertisers having goods for sale, offering to take such goods in exchange for others, or to purchase for cash. Readers are advised to ignore all such offers from this quarter.

CAMERAS AND LENSES

UNUSED Rolleiflex 2½×2½, f/3.8 Tessar, automatic model, leather case, pair Proxars, filter; cost £26; accept £20; bargain; deposit system.—Box 2174, c/o "The Amateur Photographer." [4543]

The AMATEUR^{3D} PHOTOGRAPHER & CINEMATOGRAPHER

~ The Journal for Everybody with a Camera ~

Vol. LXXVIII.

Wednesday, November 28th, 1934.

No. 2403.

A Rolleiflex Picture

ONE OF THE MANY SUPERB ILLUSTRATIONS CONTAINED IN
THE ROLLEIFLEX BOOK

Every amateur photographer should obtain a copy of this book. It contains a wealth of information and discovers for the Rolleiflex owner the great and many possibilities of which the Rolleiflex camera is capable. Cleverly and interestingly written by a world expert on photography, the book shows how the Rolleiflex has revolutionized modern photography. It makes an ideal present for a Rolleiflex owner, or is equally useful for a Rolleicord user. Order to-day from your dealer. Price 6/-

Or write to the Sole Rolleiflex Importers:

Don't hesitate - Choose a Zeiss Ikon Camera

CONTAX

The supreme universal camera. It has metal focal-plane shutter giving exposures from $\frac{1}{2}$ to $1/1,000$ th second and Time. Long base, accurate range-finder; open construction of back, easy to clean and load. Interchangeable Zeiss lenses, apertures from $f/1.5$ to $f/8$. Focal lengths from $1\frac{1}{2}$ in. to 20 in.

Price, with Zeiss Tessar $f/3.5$ £27 : 10 : 0

Price, with Zeiss Sonnar $f/2$ £35 : 10 : 0

SUPER IKONTA

for usual roll films. Also in the two larger sizes for 16 pictures, by using mask supplied. Famous throughout the world as the camera that does the focussing. The Distance Meter enables the user to get the correct distance by the simple rotation of a knob, which at the same time sets the lens to that distance. Price, for 16 pictures :

$2\frac{1}{4} \times 1\frac{1}{2}$ in., Tessar $f/3.5$ £16:12:6

8 pictures (or 16 divided) :

$3\frac{1}{4} \times 2\frac{1}{4}$ in., Tessar $f/4.5$ £17:10:0

$4\frac{1}{2} \times 2\frac{1}{2}$ in., Tessar $f/4.5$ £18:15:0

SUPER NETTEL

Takes $1\frac{1}{2} \times 1\frac{5}{16}$ in. pictures (24×36 mm.) on cine perforated film. Automatic focussing by distance meter—metal focal-plane shutter from $1/5$ th to a guaranteed $1/1,000$ th second. Either Zeiss Tessar $f/3.5$ or $f/2.8$. Is so conveniently operated that one can, without removing it from sighting point, "wind-snap" and thus take pictures at intervals as short as one second.

Price, with Zeiss Tessar $f/3.5$ £21:12:6

Price, with Zeiss Tessar $f/2.8$ £23:10:0

NETTAR

is everybody's EVER-READY roll-film camera, for $3\frac{1}{4} \times 2\frac{1}{4}$ in. roll films, 8-exposure spools. Equipped with rapid anastigmats, and self-opening by pressing a button. The Zeiss Ikon "two-dot" system makes possible sharp pictures without special focussing by simply adjusting focus and diaphragm to respective dots.

Price, with Novar $f/6.3$ £3 : 10 : 0

Price, with Novar $f/4.5$ £5 : 5 : 0

BOX TENGOR

The Aristocrat of Box roll-film cameras. The ideal instrument for amateurs wanting a really good camera at a low price. Takes 16 pictures $2\frac{1}{4} \times 1\frac{1}{2}$ in. on usual $3\frac{1}{2} \times 2\frac{1}{4}$ spool, also in other sizes. Made of metal, GOERZ Frontar lens $f/11$, nearly double the rapidity of the lenses of most box-type cameras.

Price: $2\frac{1}{4} \times 1\frac{1}{2}$ in. £1 : 2 : 6

$3\frac{1}{4} \times 2\frac{1}{4}$ in. £1 : 5 : 0

TRONA IKONTA

Double extension model with Zeiss Tessar $f/3.5$, for Plates or Film Packs. With the very large aperture one can give the very short exposures required for objects in rapid movement. Will take portraits in ordinary rooms without aid of extra lighting, and for snapshots out of doors the light almost ceases to be a factor to be considered.

Price, with Compur shutter and three slides, $3\frac{1}{2} \times 2\frac{1}{4}$ in. £18 : 12 : 6

Most modern of all automatic-opening roll-film cameras. It provides a wide range of optical equipment and contains the Zeiss Ikon "red-point" focussing feature to aid the snapshotter. Self-erecting front, compact design, beautiful finish and first-class equipment. Four sizes. Prices, with Tessar $f/4.5$ and Compur shutter :

Baby ($1\frac{1}{8} \times 1\frac{1}{4}$ in.) .. £8 : 17 : 6

$2\frac{1}{4} \times 1\frac{1}{2}$ in. £10 : 0 : 0

$3\frac{1}{4} \times 2\frac{1}{4}$ in. £11 : 5 : 0

$4\frac{1}{2} \times 2\frac{1}{2}$ in. £12 : 15 : 0

Other prices from .. £3 : 7 : 6

Ask your dealer or send a post card direct to us for lists and further information of any Zeiss Ikon camera mentioned in this announcement.

AVOID THAT WILD RUSH AT THE LAST MOMENT

Someone is bound to be forgotten—You get the widest choice by shopping early.

LEICA III WITH F/2 SUMMAR

No matter how dull the weather may be, Leica simply insists on getting nothing but the best pictures. Speeds from 1 to 1/500th sec. Distance measuring and lens-focusing are done in a single action. Takes 12 or 36 pictures at a loading. **\$35:5:0**
Nine monthly payments of 82/3.

FOCOMAT ENLARGER

With automatic focussing. With effortless speed this enlarger will give perfect pictures from your Leica negatives whether you want enlargements to the size of 3½ x 2½ in. or up to 12 x 10 in. The diffused illumination gives soft, harmonious enlargements, and eliminates any possible scratches on the negative. Pre-eminently suitable for the enlargement of miniature negatives. For use with Leica camera lens

£13:19:6

Nine monthly payments of 32/7.

KODASCOPE 'D'

16-MM. PROJECTOR

Complete with 300-watt lamp. Fan-cooled. Automatic rewind. Beautifully finished in bronze. Gives silent, clear and flickerless projection.

£25

Nine monthly payments of 58/4.

THE 'SUPER IKONTA'

With coupled distance meter. The camera that does the focussing. No. 530, takes 16 pictures on 3½ x 2½ roll film. A modern, up-to-the-minute precision instrument. With Zeiss Tessar f/3.5 lens and Compur shutter.

£16:12:6

Nine monthly payments of 38/10.

Vol. LXXVIII. No. 2403.

PHOTOGRAMS OF THE YEAR makes its appearance again next week, and will be welcomed by many thousands of photographers and picture-lovers in all parts of the world. The new volume for 1934-35 will contain its usual rich and varied collection of reproductions of the best work by pictorialists of every country, and it is the international character of this popular annual that distinguishes it from all others. There is also the fact, and one that appeals to every broad-minded reader, that no special phase of photography is emphasised at the expense of others. In this, the 40th year of publication, *Photograms* will be found to be as up-to-date as the most progressive of modern camera workers can desire, without losing sight of the claims of those workers who continue with the more classic representations of nature. As a finely illustrated book it will make an ideal Christmas gift for any photographer. Orders should be placed without delay at booksellers, dealers or bookstalls, or sent direct to the publishers, Messrs. Iliffe & Sons Ltd., Dorset House, Stamford Street, S.E.1. The price is 5s. paper covers (post free, 5s. 6d.); cloth bound, 7s. 6d. (post free, 8s.).

A Modern Photographic Outing.

Thanks to the motor car, photographic excursions to the most out-of-the-way places have become possible. In the old days a party of photographers would travel by train to and from a selected place, and very often their field of work was limited because of the lack of travelling facilities; but things are a little different to-day. A few days ago, on a passably bright November morning, two well-known

TOPICS of the Week

A RAINY DAY IN LONDON.

A remarkable snapshot in Trafalgar Square showing perfect reflections in the wet pavement.

members of the Royal Photographic Society, with a motoring friend, also a camera-man, left a town in Surrey and made for a Cambridge-shire village, between sixty and seventy miles distant. There they picked up a friend who was well acquainted with the district, and under his guidance the party visited fourteen villages, stopping in six of them to photograph objects of interest, using in most cases a tripod and giving time exposures, returning afterwards to their Surrey homes. Verily a good day's work on a November day, when many amateurs believe camera work to be difficult if not impossible.

Embarrassing Disclosures.

We are told that there is quite a trade in the illegitimate copying of photographs. A young lady goes to a fashionable studio and has sittings. In due course the proofs are sent for her approval, and after a little while are returned with an intimation that none of them satisfies her fastidious taste. But in the meanwhile she has betaken herself to a little hole-and-corner professional in a back street, who makes as many copies of them as she wants, and thus he gets business, and she gets superior photographs at inferior prices. Col. Mansfield, who lectured before the Royal Photographic Society the other evening on the detection of the forger by the use of ultra-violet rays on documents, has thought out a little plan whereby, adding some invisible salt to the prints so treated, the pirate photographer may be startled when he comes to look at his copying to find the words leap out in ghostly characters across the face of the sitter, "You thief!" A description alike of himself and of the fair sitter.

Diamond Cut Diamond.

The way of the forger is no longer easy, now that the ultra-violet radiations reveal his misdoings, but what rather impressed us in Col. Mansfield's exposure of how documents are forged was the clumsiness of the forger in many instances. The young man who thinks he can tamper with a death certificate by a little scratching out and overwriting deserves his eight months for his folly, let alone his crime. Of a rather different order is the clever forger who deftly eliminated the letter "y" from "your," thereby occasioning a lawsuit, in which Col. Mansfield came along, and showed up the "y" and the wherefore at the same time. These "luminograms" as Col. Mansfield calls them, must strike terror to the forger's heart. He tells us, too, that ice is valuable for detecting alterations in documents. Often, even with the ultra-violet fluorescent, it may not be possible to see anything significant, but if the stamp or whatever it be is put on a piece of ice the transgression is immediately apparent. It is the short waves, the cold end of the spectrum, that defeat the forger, and the

other end, the infra-red, has proved of no particular value. Perhaps the forger of the future will in his turn take up the study of the infra-red and outwit the detective with his ultra-violet.

Deceptive Back Views.

Ceylon is the island we sing about where every prospect pleases and only man is vile. We have always thought this was a libel on the Cingalese, and now a returned traveller from that spicy land tells us that it is certainly untrue of the Cingalese from one aspect, for they are, for the photographer, the finest models in the world. They are completely lacking in self-consciousness, and yet they know what is expected of them. Their skin is of a beautiful golden-brown colour, and their bodies from the neck to the waist have a curiously lithe and willowy appearance which fits them at once into a rectangular frame. The men wear their hair in a bun at the back, or sometimes it falls in wavy tresses to the waist, which has its disadvantages, for the photographer may see one of them in front of him and determine to get a face view of this lovely maiden,

but "she," when he gets himself into position, proves to be a bearded and toothless old man.

The Dog and the Poster.

Until recently (writes a correspondent) I had an idea that animals—even that most intelligent of animals, the dog—could not appreciate pictures on the flat. My own little black-and-tan terrier was to teach me better. I was seeing some friends off on the station platform when "Mac" spotted a large poster advertising a certain dog biscuit. The poster illustrated a life-size dog with a wistful expression of countenance, which aroused "Mac's" liveliest interest. He sprang on to the platform seat just below the poster, put his forepaws on the back of the seat, and gazed up at the poster as one dog to another, making a dismal howl meanwhile. I took him to the platform again next day, when he kindly repeated the performance, and a photograph including the poster has been taken and sent to the proprietors of the dog biscuit. "Mac" now expects a gratuitous supply of that nutritious article for the rest of his life.

READERS' PROBLEMS

Selected queries on topics of general interest to readers will be fully dealt with on this page week by week. Other replies appear as usual on the last page.

Copying Daguerreotype.

I have a valuable daguerreotype portrait from which I particularly want to get some good photographic copies. The plate is badly tarnished, so that the image is not at all clear. If you think it is possible for me to copy it, will you please describe the procedure? I have had some experience of ordinary copying.

C. L. E. (Glasgow.)

You must realise, first of all, that doing anything at all to a daguerreotype involves a certain amount of risk, even in skilled hands. It is often the case, however, that the portrait has become so obscured that it is of no interest or value as it stands, and so it is worth while taking the risk in the hope that all may go well, and the portrait be restored to its original condition.

Bear in mind that from beginning to end of the proceedings the surface of the plate must on no account be touched, even with a finger-tip, or irreparable damage may result.

You must first dismantle the daguerreotype, by removing it from its frame or case. You will find the glass and the copper plate bound together with paper. It is best to immerse the whole thing in clean water till the paper binding comes away, and the plate can be handled separately by the edges alone.

If the tarnish is a steely blue in colour it may be removed by a plain hypo bath, but in any case we prefer the following treatment, which will remove tarnish that will not yield to hypo. Obtain a small quantity of potassium cyanide, which is a deadly poison and must be signed for. Make up a solution of five grains to the ounce of the distilled water.

Lay the plate in a clean dish and flow the cyanide over it, rocking gently. If necessary pour off and renew the solution till the tarnish has completely disappeared. Then rinse the plate well in ordinary water, finishing in several changes of distilled water. To dry, hold the plate by one corner with pliers, drain, and hold at an angle above a spirit lamp so that drying starts at the top corner and proceeds evenly and rapidly to the bottom.

To copy the portrait it is well worth while, if not absolutely necessary, to fit up an accessory for the purpose. First ascertain the distance required from lens to portrait when making the copy, and make a long narrow box of a trifle over this length. The box may be of stout cardboard, or of plywood, and must be painted dead black inside.

One end of this box, or square tube, is pierced for the lens to peep through. At the other end are runners into which the daguerreotype can be slid, so that it is supported in a vertical position at the end of the box. Further, a part of one side of the box, at this end, must be cut away, so that light can reach the portrait.

The box must be manipulated in relation to the source of light, until the portrait, as seen by the lens, is at its best, and the copy can be made. As you are familiar with copying there is no need to enlarge upon this stage of the work, but you will find that exposure has to be decidedly on the long side, and development rather full.

The plate and glass must be bound together again with great care, the object being to exclude air, or further tarnishing will soon appear.

In Search of NEGATIVE QUALITY

Such widespread interest has been aroused recently on the subject of modern roll-film materials, their grain-size, speed and colour sensitivity, that the following observations, conducted over the last few months, may prove of some help to those who, through lack of funds, patience or time, are unable to go into this very absorbing question whole-heartedly themselves.

IT will be readily understood that different types of film have different characteristics—for instance, a medium-speed fine-grain film will, as will be explained later, give a slightly better rendering of tone values than a similar film of three or four times that speed, quite apart from the fine-grain qualities of the former.

As panchromatic emulsions are used almost exclusively by serious photographers, all the following tests were made on this type of film, but the remarks should apply equally to ordinary non-colour-sensitive films and plates.

The films used for the tests were divided into two classes, viz.:—

A. Medium Speed.

Agfa Pan Fine Grain.
Kodak Panatomic.
Selo Fine Grain Pan.

B. Super Speed.

Agfa Super Pan Ultra-speed.
Kodak Supersensitive Pan.
Selo Hypersensitive Pan.

Tests of exposure of the films of Class A revealed an almost uniform speed. On development with a normal M.Q. developer containing soda carbonate, all Class A films showed brilliance of image, fine grain, and complete absence of fog.

It must be noted here that the development time of these films is comparatively short, otherwise excessive contrast and a coarser grain size will result.

The next step was then to see what could be done to secure a still finer grain size. Accordingly, Burroughs Wellcome fine-grain "Tabloid" developer and Johnson's "fine grain" developer were tried according to their instructions.

Class A films were then developed in these developers and revealed results showing slightly less grain

than the normal M.Q. developer. An M.Q. Borax developer gave similar results.

To make the test complete another fine-grain developer was sought, and a choice made of pyro-acetone, of which the following is a typical formula:—

| | |
|-----------------------|----------|
| Pyro | 63 grs. |
| Acetone | 36 min. |
| Soda sulphite (anhy.) | 900 grs. |
| Pot. bromide | 9 grs. |
| Water | 20 oz. |

Again Class A films were developed, and results compared with those developed in aforementioned developers.

Here is a summing-up in a nutshell of the developers employed:

Class A Films.

Developed in normal M.Q. developer containing soda carbonate: Plucky negatives of excellent contact printing quality, grain objectionable on medium glossy paper at 14 diameters.

Burroughs Wellcome and Johnson's fine-grain developers: Slightly softer negatives of ideal enlarging quality. Grain size remarks as above.

Pyro-acetone developer. As above *re* softness and enlarging quality. Grain size objectionable at 16 diameters.

It was therefore very evident that when a special fine-grain emulsion is used, there is little one can do to reduce grain further by developers alone; it is more a question of not increasing the grain size by attention to the following:—

A.—Full exposure.

B.—Minimum development time consistent with contrast.

C.—Temperature of all chemical and washing processes fairly constant between 60 and 65 degrees Fahr.

D.—Drying in current of dry air at about 75 degrees Fahr.

Now to the trial of the super-

sensitive panchromatic films in Class B, all of which are of a relatively high speed, and have a pronounced sensitivity to the red regions of the spectrum, rendering them extra sensitive to artificial light.

Class B Films.

Development of these Class B films was carried out in exactly the same manner as Class A, with the exception that development time was of necessity increased by nearly as much again as Class A films.

Results showed: Developed in normal M.Q. containing soda carbonate. Coarse grain, and a definite loss in high-light gradation as compared to Class A films. Grain well marked at 6 diameters on medium glossy paper.

Burroughs Wellcome, Johnson's and borax developers. Grain much finer, still a loss of high-light gradation, and contrast rather low. Grain observable at 9 diameters.

Pyro-acetone. Grain still finer, high-light quality poor, and contrast poor. Grain objectionable at 12 diameters.

By developing Class B films for more contrast, either by using stronger developer or longer development time, an improvement is made in general printing quality, but only at the expense of a coarser grain size.

Films of great speed require much more careful thought as regards exposure and subsequent treatment than those of medium speed, but, provided that consideration of their limitations in high-light response is applied, they can, and will, if properly treated, produce negatives of a very high standard.

Their very speed makes them indispensable, especially for pictures which have to be taken under adverse lighting conditions, but, for perfect "quality," a medium-speed film is to be preferred. A. FURNESS.

Lettering for Photograph Titles

By
DONALD TUCKER.

The winter evenings will see amateur photographers at work on their pictures of the summer. By no means unimportant when the prints are at last finished and mounted is to title them. With ciné pictures, also, it is the titles which give interest and coherence to the whole. Unfortunately, many good pictures are spoilt by bad lettering; a few words in season may not, therefore, come amiss.

A CASUAL glance through displayed newspaper advertisements reveals a variety of letter styles. Like other forms of artistic expression, lettering is largely a matter of taste; present-day tendencies are toward neatness and simplicity more than to the grotesque or over-decorated, and in titling photographs it is better to depend upon correctness of shape and clearness of line rather than elaborateness.

Aptness of the style chosen should always be taken into consideration; Old English black letter would be incongruous if used in describing pictures of an aircraft display, but the same characters would be in keeping with photographs of a cathedral.

Not all founts of letters used in books and newspapers are suitable for freehand reproduction. It is best

to adopt a style which naturally adapts itself to the pen. Series one and three illustrated here are admirable styles to copy for that reason. The other series may also be found useful.

If the amateur wishes to give variety to his album pages he may find many suggestions in the displayed advertisements already mentioned, while Vere Foster's copybook of "Plain and Ornamental Lettering" (published by Blackie and Son) is a great help. Most booksellers probably have other books on the subject that can be inspected. In seeking variety of style, however, it is best to limit oneself to three "founts" for any one album page or movie title.

Using correct materials will assist toward a happy result. White ink should be used on black or dark-toned papers; indian ink may be used on

light-toned backgrounds. Ciné titles are best made on black paper with either white ink or white-lead pencil (Conté de Paris, 4d. each); white ink is more adaptable to thumbnail sketches if these are included.

Pens should be chosen according to the work they are to do. For black-letter text and thick-stemmed letters a "Relief" or "J" nib is suitable, but for fine hair-lines something more pointed, such as a mapping pen, is called for.

Most artists' colourmen and stores also supply special pens and nibs for lettering. These are made in a variety of thicknesses and flexibility. One or more should certainly be bought if much lettering is done.

Finally, do not blot the work, but allow it to dry naturally, after which pencil lines, if used, may be erased with a soft india-rubber.

LANTERN SLIDES IN BLACK-AND-WHITE

A SIMPLE method is suggested where it is proposed to make diagram slides showing figures in line black-and-white, such as copies of graphs, copies of simple illustrations out of textbooks, or titles which are to be printed by hand.

A piece of cellophane paper of the clear white variety is gummed to a card frame larger than the size of the slide, i.e., $3\frac{1}{2} \times 3\frac{1}{2}$ in., and the gum is allowed to dry, care being taken that the card does not warp unduly in the process. The subject matter is then

written or traced upon the cellophane, using a good indian ink. Next, the cellophane is cut to the size of the slide and is mounted in the usual way between two slide covers.

Upon projection, if the hand-work has been carefully executed, the result is equally as good as the same thing photographically copied and a slide made from the negative. The method suggested has the advantages of being easier of control, and is, of course, much cheaper.

Slides of a purely temporary nature can be made by making a small frame the size of a lantern slide, and writing upon a piece of cellophane stretched over the frame and gummed in position. These will pass into the projection gate of most lanterns, but the slide carrier of many lanterns is so constructed that it is essential to mount the cellophane between glass. This is also advisable where the source of light is one giving out great heat.

RUSSELL C. VERNON.

GET IT AT "THE WESTMINSTER" YOU CANNOT DO BETTER

PATHÉSCOPE 200-B PROJECTOR—9.5-mm.

OUTSTANDING FEATURES:

Fitted with highly efficient 250-watt direct lighting system, giving a brilliant screen picture 10 ft. wide. Flickerless projection. Very compact. Fan-cooled and asbestos-lined lamp-house. Simple threading. Universal tilting movement. Motor rewind for use on A.C. or D.C. supply, complete with lamp and motor drive for use on any voltage from 200 to 250 volts. 300-ft. empty reel and flex. Please order—300-ft. state voltage when ordering. **£15:0:0**

Nine monthly payments of 35/-.

The PATHÉSCOPE HOME MOVIE PROJECTOR 9.5-mm.

Gives a perfectly clear, brilliant, and flickerless picture, 4 ft. x 3 ft., 12 ft. from the screen. Complete with mat. plug adapter and 12-volt lamp, for use on 110 volts. **£6:15:0**

Nine monthly payments of 15/9.

The "Kid" Projector, complete with resistance for use on all voltages from 110 to 250 volts, and 12-volt lamp. **55/-**

READY SHORTLY!

The new "Imp" Projector, 9.5-mm., complete with motor drive, super-reel attachment and group resistance, for use on all voltages from 100 to 250, complete with **£7:0:0**

Nine monthly payments of 16/4.

The DEKKO CINÉ CAMERA

for 9.5-mm. films.

British Made.

20-mm. f/3.5 Dallmeyer anastigmat (fixed focus), interchangeable screw-in lens mount. Variable speeds, half to normal and slow motion, 64 pictures per second, single-picture device, spring drive taking through roll 30-ft. of film at one winding, telescopic type finder. Body of special wear-resisting bakelite. All outside fittings and film gate chromium plated. **£6:6:0**

Nine monthly payments of 14/9.

Fitted 1-in. f/1.9 Dallmeyer anastigmat, micrometer focus **£8:18:6**

Nine monthly payments of 20/10.

The EXAKT ENLARGER

Fitted f/4.5 Steinheil Cassar anastigmat, complete with condenser and orange filter. Very simple adjustment to obtain size of enlargement required.

Model Ia for 2.5-10 times linear enlargements from 4 x 4 cm. negatives **£13:10:0**

Nine monthly payments of 31/6.

Model II for 2 to 7.8 times linear enlargements from 6 x 6 cm. negatives and sections of 4-plate. **£18:0:0**

Nine monthly payments of 42/-.

THE ENSIGN MIDCET MAGNAPRINT ENLARGER

F/6.3 Ensign enlarging lens, specially designed condenser for enlargements up to 15 x 12 in., chart giving various sizes. Will also take half-V.P.K., Leica, or other small negatives. Complete with electric fitting. Less lamp. **£4:10:0**

The V.N.

SEMI-AUTOMATIC ENLARGER

3 1/2 x 2 1/2, f/4.5 Dallmeyer anastigmat, for enlargements up to 12 x 10

£8:15:0

Nine monthly payments of 20/5.

4 1/2 x 3 1/2, f/4.5 Dallmeyer anastigmat, for enlargements up to 15 x 12

£9:15:0

Nine monthly payments of 22/9.

LIBERAL EXCHANGE ALLOWANCES.

The ZEISS IKON MIRAPHOT ENLARGER Automatic Focussing

Each Miraphot is sold complete with special Miraphot lamp, short length of flex with plug for wall socket, and one fit-over stop. No. 1444 also includes one adapter, taking 4 1/2 in. negatives.

For negatives not exceeding 3 1/2 x 2 1/2 in. **£7:12:6**

Nine monthly payments of 17/9.

No. 1445 12 3/4 x 2 1/2 in. Zeiss Tessar f/4.5, 3 1/2 x times linear **£10:2:6**

Nine monthly payments of 23/8.

For negatives not exceeding 9 x 12 cm. No. 1444 16 1/4 x 3 1/4 in. Novar **£10:10:0**

Nine monthly payments of 24/6.

The Leitz 'FOCOMAT' ENLARGER With Automatic Focussing.

Takes the standard 50mm. focus Leica lens, screw-in fitting, automatic focussing adjustment, scaled from 2 diameters up to 10 diameters. Will take negatives 18 x 25 mm., 24 x 36 mm., 3 x 4 cm., and 4 x 4 cm. Metal masks can be supplied for any of these sizes.

(Write for Leaflet.) **£13:19:0**

Nine monthly payments of 32/7.

The 'WESTMINSTER' ENLARGING EASEL DE LUXE (Reg. Design)

NEW AND IMPROVED MODEL

(Showing front open for receiving paper.)

Salient Features.—Absolute rigidity. Rising and falling front. Tilting and rotating movement (spring ball lock for centre), special spring pressure board ruled for all sizes up to 15 x 12, with special hinged glass front, supported by sliding strut, which leaves both hands free for placing paper in required position. Rapid in use. Accurate in register. Reduced price Carriage paid Great Britain. **£3:15:0**

(A charge of 5s. is made for packing-case, which is refunded in full upon return of case).

HIRE-PURCHASE TERMS.

THE G916 BOLEX PROJECTOR

Specification.—2-in. f/1.6 Hugo-Meyer Projection lens, electric motor drive, with forward and reverse movements, all gear driven, "still" picture device, motor rewind, air-cooled lamp-house and mechanism, separate controls for lamp and motor, stainless steel pressure-plate and gate, simple masking device, ammeter, and variable resistance to lamp-house, direct lighting system. Very efficient outfit. Light and compact.

Price, with 110-volt 400- or 500-watt lamp for use on A.C. or D.C. current. **£47:0:0**

Nine monthly payments of 10/8.

Resistance for use on voltages 200 to 250 volts **£2:10s.**

BOLEX MODEL DA PROJECTOR

A machine with outstanding advantages.

Takes 9.5 or 16 mm. films (special device for notched titles). 250-watt special projection lamp, electric motor drive, forward and reverse. Still picture movement. Fan cooling device, f/1.6 projection lens. **£36:0:0**

Nine monthly payments of 54/-.

Model P.A., for 9.5-mm. films only (special device for notched titles). 250-watt lamp, electric motor drive, forward and reverse. Hermatic lens, still picture device, fan cooled. **£24:0:0**

Nine monthly payments of 56/-.

Resistance for voltages over 125 V. **£1:17:6**

THE NEW KODASCOPE MODEL D

300-
WATT
LAMP

16mm.

Motor drive, with speed control, a simplified rewind system, makes it unnecessary to change the reels after projection. Complete with resistance for all voltages, 100- **£25:0:0**

Two fast grades of Kodak Film are available for the "Retina" in the new daylight loading and unloading Kodak Cassette: "Panatomic" and Super Sensitive Panchromatic.
316 per Cassette of 36 exposures

the miniature camera for everyman

"Retina"

a new KODAK product

£10-10

"Retina" Features and Fittings

SCHNEIDER "XENAR" f3.5 LENS. Wide aperture, and (owing to short focal length) liberal depth of focus. Makes picture-taking easy on dull days and at night-time by artificial light, indoors or out. Gives crisp definition that allows for big enlargement without loss of sharpness.

"COMPUR" SHUTTER 1, 1/2, 1/5th, 1/10th, 1/25th, 1/50th, 1/100th, 1/300th second, Time and Brief Time. A speed for every kind of subject. Lens and shutter fold safely away when the camera is not in use.

OPTICAL VIEW FINDER, tubular type, excludes all extraneous light. Always ready for instant action.

AUTOMATIC EXPOSURE - COUNTER records the exposures as they are made, from 1 to 36. No red window to watch.

DAYLIGHT LOADING AND UNLOADING with new Kodak 35 mm. Film Cassette. **36 EXPOSURES FOR 3/6.** Picture size: 3½ by 2½ in. (approximately 1½ in. by 1 in.).

Two fast Kodak films available for the "Retina":—"PANATOMIC" FILM. Superfine grain, panchromatic fast to daylight, relatively faster still to artificial light. Use "Panatomic" for all general purposes in the "Retina"—the extreme fineness of grain makes it ideal for big enlargements.

KODAK SUPER SENSITIVE PANCHROMATIC FILM. The lightning speed film. Fast to daylight, extremely fast to artificial light. Use it whenever you want extreme speed—for pictures after dark, for instance.

NEVER before have you been able to enjoy the advantages of a high-precision camera taking 35 mm. film for anything like the "Retina" price of £10.10.0.

New versatility and freedom, new speed and precision, new convenience and economy—the "Retina" gives you all this at a price unrivalled for a 35 mm. model.

And it is not only on account of its low price that the "Retina" is everyman's miniature camera. It is also unusually easy to use. With its Schneider "Xenar" f3.5 Lens and standard "Compur" Shutter (1-1/300th sec.) the "Retina" demands no special miniature camera technique of exposure. You take to the "Retina" easily, confidently, from the start.

Fitted with first-rate optical and mechanical equipment (see next two columns) the "Retina" is always awake to every picture chance, outdoors and in.

★What a superb Christmas Gift the "Retina" would make!

The PERSONAL touch

COLOUR YOUR OWN PHOTOGRAPHS BY HAND

WITH A **Kodak**

Soluble Crayon Outfit

It's easy! There's no need to be good at drawing; you don't even have to follow the outlines accurately, as transparent colours do not obscure them. If it does not look right at first, colour can be removed without the slightest damage to the print surface. By blending the crayons the most delicate effects are obtainable, and you can produce work which has individuality, and is really "your own."

EXPOSURE *and* ENLARGING

MANY amateurs, when balancing their photographic budget, must have found the item "Bromide Papers" somewhat high compared with the results obtained. We have all experienced the difficulty of judging exposure accurately, but the following method should enable waste to be cut down to a minimum.

Only a very simple piece of apparatus is needed, and this consists of a "Justophot" or other exposure meter working on the extinction principle, and a light-tight container for an electric bulb, similar to that shown in Fig. 1 herewith. A is a wooden box, with a lamp, B, at one end, a diffuser, C, about 3 in. from the opposite end, and an opening, D, to hold the negative. It is, in fact, a lamphouse and negative-holder, and those who have an enlarger (preferably one working on the diffused-light principle) will have the necessary apparatus ready-made, provided that the essential parts can be readily detached.

The completed accessory is shown in Fig. 2. X is the exposure meter, suitably mounted at a fixed distance from Y, the lamphouse; Z is a shade, made of cardboard or other suitable material, which helps to prevent extraneous light from reaching the exposure meter.

The whole apparatus is very simple to use. A negative of average density is selected, and the correct exposure required to give a good print ascertained by the "test-strip" method. The negative is then placed in the holder, the light switched on, and the reading taken with the meter in the same way as if a photograph were to be taken.

Let us assume that the negative gave a good enlargement in 30 seconds, and that the meter reading was $1/5$ th of a second at $f/8$. A second negative, which it is also desired to enlarge, is substituted and a meter reading again taken. If this came to, say, $1/5$ th of a second at $f/11$, it is clear that the light passing through the second negative is twice as strong as that passing through the first, i.e., the second negative is only half as dense as the first, and therefore requires only one-half the exposure, namely, 15 seconds.

The exposure could similarly be calculated for negatives of

all densities, without resorting to the use of test strips. The method, however, is most useful when used in conjunction with the latter, as the exposure can first be calculated by means

FIG. I.

FIG. II.

of the meter, and then confirmed by means of a small piece of sensitive paper. This is of especial utility when making pictures for exhibition work, where the quality of the print is of first importance.

W. E. H. FULLER.

"The A.P." Monthly Competitions PRIZES AND RULES.

To encourage pictorial outlook and good technique in the photographic work of our readers in all parts of the world.

(I) For Advanced Workers.

This class is open to all amateur photographers.
FIRST PRIZE.—One guinea in cash or "A.P." silver plaque (optional).

SECOND PRIZE.—Half a guinea in cash or "A.P." bronze plaque (optional).

THIRD PRIZE.—Five shillings in cash.

A special prize of five shillings in cash for the best mounted picture.

CERTIFICATES OF MERIT.

In addition to the general rules (see below), the following conditions apply:—

(1) All prints must be accompanied by a stamped addressed envelope or wrapper if they are to be returned. Prints receiving an award will be retained.

(2) Prints must be mounted, but not framed.

(3) Returnable prints in the Advanced Section will be sent back with a typed criticism, and classified according to merit.

(4) Prints may be of any size and by any process, and must be the competitor's own work throughout.

(5) The award of a prize or certificate in the Advanced Workers' Competition or any other competition or exhibition will not debar the competitor from entering again on future occasions and winning further prizes.

(II) For Intermediate Workers.

This class is to encourage those readers who have passed the "beginner" stage and may have won an award in the Beginners' Competition, but have not progressed sufficiently to enter in the Advanced Competition.

FIRST PRIZE.—Half a guinea in cash.

SECOND PRIZE.—Five shillings in cash.

CERTIFICATES OF MERIT.

In addition to the general rules (see below), the following conditions apply:—

(1) No print must be larger than 10×8 in., and can be by contact or enlargement by any process, and may be mounted.

(2) The whole of the work (exposure, development, printing, etc.) must be carried out by the competitor.

(3) Prints entered in the Intermediate Section will be criticised and returned if accompanied by stamped addressed envelope or wrapper. Prints receiving an award will be retained.

(4) The award of a prize or certificate in the Intermediate Competition debars the competitor from entering this competition again, but he is then eligible for the Advanced Workers' Section.

(III) For Beginners.

This class is open to those who have never won an award in any photographic competition or exhibition.

FIRST PRIZE.—Half a guinea in cash.

SECOND PRIZE.—Five shillings in cash.

CERTIFICATES OF MERIT.

In addition to the general rules (see below), the following conditions apply:—

(1) No print must be larger than 6×4 in. Contact prints or small enlargements up to this size are eligible, but must be unmounted.

(2) The exposure must have been made by the competitor, but developing and printing may be the work of others.

(3) No prints can be criticised or returned.

(4) The award of a prize or certificate in the Beginners' Competition debars the competitor from entering this section again.

General Rules.

(1) Any number of prints may be entered, but each print must have on the back the appropriate coupon

(see advertisement pages) the date of which must be within five weeks of the closing date of the competition. Overseas readers may use the most recent coupons to hand.

(2) Each print must have on the back the name and address of the competitor, and the title.

(3) All entries must be addressed to The Editor, *The Amateur Photographer*, Dorset House, Stamford Street, London, S.E.1, and the package must be marked on the outside "Beginners," "Intermediate," or "Advanced," as the case may be.

(4) No packages will be received on which there are postage charges to be paid.

(5) No communications on other matters should be enclosed with competition prints. No correspondence in connection with the competitions can be undertaken.

(6) The entry of a print will be regarded as a declaration that it is eligible under the rules, and that the competitor agrees thereto.

(7) No responsibility is taken for the safety of prints, and the Editor's decision on all points connected with the competitions is final.

(8) The publishers of *The Amateur Photographer* shall have the right to reproduce, without payment, any print entered, or to allow its reproduction in any other paper quoting from *The Amateur Photographer*.

(9) The closing date of each competition is the last weekday of the month. Prints arriving late will be entered for the next month's competition.

(10) The cash prizes awarded in these competitions are despatched on the fifteenth of the month following the announcement of the awards.

The closing date for the November competition is Friday, November 30th, and for the December competition, Monday, December 31st.

THE NURSERY as a for the Amateur

"Removing the Soap." Selo Panchromatic, 10 grs. flashpowder, f/22.

ALL parents—and aunts and uncles—love to receive pictures of their own or relatives' children, particularly at Christmas-time; but how few know how to make those pictures in their own homes!

Here is described how any intelligent amateur camera-user may enjoy the pleasant and inexpensive pastime of child photography in the easiest possible way.

With the end of summer daylight, most amateur photographers put away their cameras, not thinking of the wonders of flashlight.

Many readers will think expensive apparatus is necessary, but, whilst it is nice to have the very best for easy working, first-class results can be obtained with the simplest box "Brownie," or other similar cheap camera, and a shilling's worth of flashpowder. A "Brownie," with its lens aperture of f/11, is ideal for definition in flashlight work, and, providing fast film is used, perfect exposures can be obtained with 10 grains of powder fired at about six to eight feet from the subject.

The difficulty, with cameras having only a small view-finder and no focussing-screen, is in composing

and focussing the picture, and this is where money can be well spent on a reflex or other screen-focussing type of camera; but, with a little practice and a foot rule, distances and centralisation of subject can be judged to a nicety. Also, as the nearest focal distance of a cheap camera is usually about nine feet, the type of studies possible is limited to general subjects such as

camera with little or no extension will overcome this difficulty to some extent. The camera should be used on a tripod or other firm support.

Regarding the lens. The large aperture of f/4.5 is very useful for composing and focussing with a reflex camera, but in practice I never use a larger aperture than f/6.3, and always prefer f/11 or smaller to obtain the greatest detail.

Small apertures, of course, require very fast films (or plates), and the brightest possible light, but happily both are easily obtained.

The fastest emulsion nowadays is panchromatic, and as modern high-speed pan. films are even more sensitive in artificial light they give the best results for this work, and are well worth the slight extra cost.

Flashpowder is sold in shilling packets, giving a dozen or so pictures, if ten grains is the usual amount fired.

The example pictures were made on all makes and types of emulsion, the lens aperture being altered to suit their different speeds, but for the beginner in flashlight work it is far best to use only one make and type of film, as then the same amount of flashpowder will perfectly expose pictures taken at the same aperture in each case.

"Early Words." Granville Ortho, 10 grs. flashpowder, f/8.

illustrations Nos. 2 and 3.

For intimate child studies close-ups are essential, and so it is an advantage to have a camera which will focus to within three feet—or nearer. Most roll-film cameras—even the cheapest—will do this. But, of course, a portrait attachment fitted to any

"Madame Entertains." Agfa Isochrom, 10 grs. flashpowder, f/8.

Studio Photographer

By J. C. HAYWARD.

The room in which the accompanying photographs were taken was an attic nursery, measuring only seven feet by eight feet, and the light plain paper on the walls was doubly useful as a reflector and unobtrusive background.

When starting this subject choose a time when the child is not overtired, but remember good pictures of sleeping children are rare and well worth obtaining. Get the child interested in some hobby or game. Judge the distance correctly and see the camera is level. After a few shots the child will cease to blink or be startled at the

"The Bedtime Book." Wellington Anti-screen, 10 grs., f/8.

"Repose." Imperial Soft Panchromatic, 10 grs., f/22.

clear. If the room is at all lofty, it is best not to open windows and doors while the work is in progress. The smoke will then remain undisturbed near the ceiling for some time before descending.

With the flashpowders as sold, informative tables are issued giving the correct amounts and distances for various subjects, but in the

circumstances described here 10 grains will be ample.

For firing the flash, there is nothing to beat one of the small hand flashlamps which are fired with a trigger and sparking-flint. If these are kept clean and in good order, they are perfectly reliable and respond to a pressure of the

finger instantly. The flashlamp can be held at arm's length to one side and above the level of the head, but in such a position that it does not shine into the lens. Particular care must always be taken that no draperies or curtains, etc., are near the flash.

"My Lady's Toilet." Granville Ortho, 10 grs., f/8.

flash, and will enter into the spirit of the game.

The ordinary room illumination may be kept burning during the whole operation if a dark-coloured handkerchief is draped over the lens, while open, being momentarily flicked aside with one hand when the flash is fired.

There are several excellent ready-made flash-powders on the market, such as Johnson's and Agfa. These are practically smokeless, but as a certain amount of smoke appears to be inevitable, the pictures should be planned beforehand so that two or three can follow in quick succession, and then allow a period to elapse for the smoke to

NOTES & NOTIONS
for the
LESS ADVANCED
WORKER

Every week an article will appear under this heading dealing with a topic of interest to the novice in photography.

POINTS ABOUT DEVELOPMENT.

A GREAT many questions buzz around me about development, especially that method known as "time and temperature." The very nature of the questions often shows misapprehensions about development in general, and this method in particular; for example, "How long should a negative be in the developer?" to which the only answer is, "Till it is time to take it out."

All development is actually a question of time and temperature, inasmuch as the negative must be in the solution for some time or other, and that this time may have to be increased or diminished according to the temperature of the solution.

I will try to deal in the simplest possible manner, not so much with one method of development, but with the general principles underlying all negative-making. Put broadly, the problem is this. We have to produce in the negative a certain range or series of tones or densities, so that these in turn will produce a corres-

ponding series of tones in the positive. We may suppose, for the sake of simplicity, that the positive is a "black-and-white" print, such as we make on bromide paper.

In the negative we may want only a short range of tones, or a long one. The subject may contain a longer range of tones than we can secure on either negative or print. No printing paper can render *more* tones than there are in the negative, but it may often register *fewer*.

The simplest proposition of all is to make a negative of a "black on white" subject, such as a line drawing in jet-black ink on a pure white paper. The parts of the negative representing

Fig. 1.

the black lines must be so clear that they will pass sufficient light to the paper to produce the deepest black the paper will give. The parts of the negative representing the white paper must be so dense that during the whole of the exposure they will not allow light to penetrate to the paper so as to degrade it in the slightest. With proper methods and materials this is easily done, and we can get a print practically indistinguishable from the original drawing.

Our usual negative-making is not by any means so simple as this.

To go a step farther I want you to consider making a copy of a drawing of the kind shown in the illustration. This particular example is from an original wash drawing of what the artist calls the oldest inhabited house in England, but I do not ask for any correspondence challenging the statement.

The artist's lightest parts in the sketch have been obtained by leaving the white paper; his darkest touches by using indian ink at full strength; and between these two extremes he has introduced washes and touches of different strengths, from the palest of greys to a tone almost as dark as the black itself.

So in making a photographic copy of it the problem was to produce a

Fig. 2.

negative that would give a print with the following features. The paper must be white where the artist had left his paper white. There must be a deep black deposit of silver where the artist had used full-strength colour. Between the two must be as complete a series of gradations of silver deposit as there were intermediate tones in the sketch. My original print shows all these features exactly, although the reproduction does not.

I refer to Fig. 2; because it is evident that Fig. 1 does not show anything corresponding to the white paper or the black touches, nor does it show more than a scanty few of the other tones. Both negatives had the same exposure, and were put into the developer at the same time, but No. 1 was taken out long before No. 2. The difference between the two results is due to different development times. I could print No. 1 darker or lighter, but it would be false either way.

Suppose that soon after the two negatives were put into the developer I took one out, and could examine it in a good light without its fogging all over, what should I see? The greater part of the surface would have its original creamy appearance, and here and there might appear little patches of grey, some rather darker than others. The darker greys would indicate the white paper of the original; the lighter greys the lightest tones in the sketch. So that we might indicate the condition of the negative by the figures 0, 1, 2; where 0 is the unaltered emulsion, 1 the light grey, and 2 the darker one.

If I had left the negative in the solution longer, the two greys would have got darker, and other various depths of grey would have appeared in the previously blank areas; so that we might now represent the condition by 0, 1, 2, 3, 4, 5.

But even then some of the very dark greys in the sketch might not

have appeared in the creamy areas, and the number 5 density might not be sufficient to stop the light so completely as to leave white paper on the print. Therefore we should have to continue development, so that we obtained such a series of gradations as 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10. Then the clear parts (0) would give blacks on the print; the densest parts (10) would keep the paper white; and the other parts (1 to 9) would fill in the intermediate greys.

This is about as far as I can go at present. It shows, at any rate, that short development will give little contrast, and that prolonging development increases it. We must assume that the exposure was such that by the time the high-lights in the print were dense enough in the negative, the greys, down to the lightest, had all appeared; and that the only clear parts in the negative were those representing the blacks in the sketch.

Letters to the Editor

The Editor is not responsible for the opinions of his correspondents.

AT AUCTION.

SIR,—In this school we have a boys' magazine club, and included in the list is *The Amateur Photographer*.

This is a new venture, and it was thought that probably some boys would like to have the copies as they were withdrawn from circulation. Consequently, they were afterwards put up for auction, and I thought that perhaps you might be interested to know that for forty-two numbers of your paper, the published price of which is 10s. 6d., the buyer paid 8s. Surely a testimony to the value of your paper, which I, personally, endorse.—Yours, etc.,

W. F. W. KING.

(Headmaster, Blue Coat School, Reading.)

A HINT TO THE R.P.S.

SIR,—Reading in "The A.P." some time back of the possible change of premises of the "Royal" in the near future, it has often occurred to me that there is further scope for extension of its amenities in the formation of a luncheon club with club licence, where members could sit and chat in comfort over lunch or refreshment.

If this is of interest, your "Letters to the Editor" page might bring other suggestions on the matter.—Yours, etc.,

RAYMOND H. DUDLEY.

NUMBERING NEGATIVES.

SIR,—With regard to the difficulty experienced by Mr. Slade in finding a method of marking index numbers on negatives, may I point out to him that an ordinary pin will scratch on the film side of the rebate a number which is perfectly legible by transmitted light?—Yours, etc.,

W. O. WITTON.

BRITISH AND FOREIGN.

SIR,—I was recently told that to be successful in British photography one should either be a foreigner or go abroad for one's subjects. This I denied, but was forced to admit that my informant was apparently right, when faced with "The Year's Photography," the R.P.S. publication.

Of fifty plates, about forty are by foreigners, or of foreign subjects; of the other ten, about six are possibly British, and only one really British, Plate V.—Yours, etc.,

H. STUART MACKENZIE.

A PHOTOGRAPHIC HUSTLE.

SIR,—Some very excellent advice given in the first column of "Pictures of the Week," attracted me. There is a class of workers, however, that it does not touch. One belongs to a society such as the Royal, or British Archaeological Societies. I belong to both. Once a year a Congress is arranged lasting a week or more. A programme of visits to churches, castles, abbeys, etc., compiled, the time allowed for inspection of each church is limited, and often curtailed from a photographic point of view by a lecture. The distance from one's home is generally considerable. To secure photographic records of the churches, etc., visited, much ingenuity of procedure is necessary. I am writing after years of experience.

How one should secure photographs of interiors you often explain—focussing camera, with swing back, backed plates, several lenses, firm tripod.

Could any reader describe the best way to secure such photographs when: Forty minutes is the scheduled time of the visit; a lecture is given from the pulpit lasting twenty minutes; the church contains inside: 12th-century font, double piscina, fine stone screen, wine-glass pulpit; outside: a scratch dial, doorway in buttress, sanctuary knocker on door under heavy porch.

This looks almost impossible. I am astonished myself at the results I secure under such conditions.

Do any of your readers make the attempt, and with what results? What is it essential to possess in the way of apparatus in order to get passable photographic records in the time?—Yours, etc.,

FRED. J. BRAND.

MINIATURE CAMERA WORK.

SIR,—Mr. C. W. Martin advises Mr. Burr to use fine-grain developer and so rid himself of his difficulty in getting definition. Alas! I know from painful experience that the trouble goes deeper than that. Can you buy for £6 to £10 an f/2.9 miniature camera which will give definition sufficient for enlargement up to postcard size? Our own "W. L. F. W." recently reviewed one and was delighted with it, but his snaps were not at the full f/2.9 of the lens. Having tried three times I can tell Mr. Burr that it *can* be done, but only if he is lucky. These cameras are mass-produced, and the price does not allow of much testing. Anyone who buys one, especially a second-hand model, should carefully test it with camera rigidly supported, and at measured distance. If under these perfect conditions the definition is not good enough then it is useless, and though many of them are, the rest are excellent. But it is pure luck.—Yours, etc.,

R. E. DICKINSON.

How I make my EXHIBITION PICTURES

No.
CCLVII.

Mr. JOHN
KEANE.

Methods and Ideals of well-known Pictorial Workers.

From information communicated to our Special Representative.

"IT may stagger some of the younger photographers to learn that I started my photographic career with a whole-plate camera. Of course, to-day no amateur would dream of using such a heavy outfit, apart from the cost of plates; but plates and materials were not the same price years ago as they are to-day. It is worth remembering, however, that with a suitable whole-plate negative it is possible to make a direct print in any medium we may choose, and that the finished print is large enough to rub shoulders with bigger brothers on the exhibition walls.

"My next camera was a 5x4 Sanderson. Then the reflex caught on, and I joined the gay throng of its warm admirers. I have never wished to change it, in spite of the allurements of the attractive and practical little instruments now fast growing in popular

favour. The only alteration I have made is to get rid of some of the weight and bulk of my quarter-plate reflex by changing to a 3½x2½, and this size I find quite sufficient for all ordinary work, especially as I never make a contact print.

"As to sensitive material I have come to prefer the film pack, though I still have a liking for the plate; one can do so much with a plate in the way of intensifying, reducing, retouching or other modification that is not quite so easy with a film. And speaking of plates I might be expected to say that I invariably use panchromatics; but in fact I do not always use them, although I admit their fine qualities. I am not convinced that a pan. plate is the best under all conditions, and as I develop by (cautious) inspection it means desensitising first. Speaking for myself,

I doubt if one gets quite the same result after desensitising as by direct development without. That is as it may be. Again, the weight of several packets of plates, even in 3½x2½ size, becomes a consideration when one is going on a holiday, especially abroad.

"My negatives are developed slowly with Azol, and with the aim of getting plenty of delicate detail that will tell in enlarging. I think that anyone should be able to make a good negative; the trouble really starts when one begins to print.

"If I were asked what is my favourite printing process I should reply that it was the oil process; not that I use it very often, but that I think it gives the picture-maker more scope than any other process (including bromoil) to express himself by exercising control. But this means an enlarged negative; and the days are gone when ardent amateurs were content to work in a dark-room until the small hours of the morning, making transparencies and then enlarged negatives. Bromoil spares us this labour and expense, and so with me has practically replaced its fore-runner, oil.

"My usual and favourite size for a print is 15x12; and I find it best, having selected the most promising negative from the latest batch, to make a straight enlargement, pin it on a drawing-board, and consider it at intervals for a week or two before deciding on the final treatment. I say the latest batch because I find there is more zest and pleasure and inspiration in dealing with the newer ones before the novelty of them has worn off.

"There is no one process that meets the requirements of every subject, and most negatives are the better for a little editing; but occasionally nature is kind, and I get just the right thing; and then a bromide print gives me all I want, choosing either a cool-toned paper or a warm one, as the subject demands. The Carbro process is one to which I am also partial, since it gives an added strength and juiciness, as well as a long range of colours."

PICTURES of the WEEK

Some Critical Comments on the Beginners' prints reproduced on the opposite page.

LAST week, the theme under discussion was the adjustment of the printing paper to the contrasts of the negative. It was shown, *inter alia*, that the purpose of making such an adjustment was to enable the print to record all the tones of the negative, and, in so doing, to render the subject tones with due regard to truth; but, at the same time, it was mentioned that the degree of colour sensitivity of the plate or film had a great deal to do with the proper rendering of the tone values of the sky.

Tone and Colour.

The ordinary run of photographic emulsions is overwhelmingly sensitive to ultra-violet and blue. Orthochromatic emulsions are faintly sensitive to yellow and green, but practically insensitive to red. The photographic image, with emulsions of this nature, is therefore almost entirely attributable to light action from the ultra-violet and blue rays.

The human eye—to use the same term—is insensitive to ultra-violet, and equally sensitive to the three primary colours—blue, red, and yellow.

There must be, in consequence, a discrepancy between the tone values given by such emulsions and those seen visually, and this difference is chiefly manifested, as far as out-of-door work is concerned, by a rendering of the sky in too bright a tone. This may not be a scientifically accurate explanation, but it is near enough to afford a foundation for practical work and provide a principle to enable the process to be understood.

Nevertheless, the colour sensitivity of ortho emulsions has been greatly advanced in recent years, and, when the conditions are favourable they can—and do—give a modicum of tone in the sky, provided, of course, that this is not rendered unprintable by over-development of the negative or not recorded on account of the use of a too-vigorous printing paper.

Printable Skies.

One or other of these mischances has happened with Nos. 3 and 6 of the prints reproduced on the opposite page—"In Harbour," by John E. Adams, and "The Lighthouse Pier,"

by B. M. Burton—for the skies are devoid of tone, and everything points to either over-development of the negative or the use of a paper of too vigorous a character. The remedy indicated last week of substituting a softer grade of paper is the only way by which an improvement may be obtained, and such is recommended.

Both Nos. 2 and 5, "Home on the Evening Breeze," by R. A. Mackintosh, and "The Paddle Steamer," by T. A. Thornton, are appreciably better, and, if the tone of the clouds is not quite all that could be wished, it is probably as good as could be got with ordinary or orthochromatic plates and films, i.e., without a light filter. With a filter of medium depth, it is just possible that more of the finer gradations would be rendered, and, in general, the sky would be recorded in a deeper tone.

A filter, however, acts by cutting out those rays of light to which the emulsion is most sensitive. If its depth is enough to be of any use, it will cut out the whole of the ultra-violet and not a little of the blue, and, having regard to the low sensitivity of these emulsions to light of the remaining colours, the increase required in the exposure time is enormous.

Screens and "Pans."

The case is different when emulsions of the fully colour-sensitive or panchromatic type are employed. They are very much more sensitive to blue, yellow and red than the ordinary or ortho class, but are still over-affected by ultra-violet. The majority are also somewhat more sensitive to blue than yellow or red, though it is claimed that they are equally sensitive to all colours.

With them it is still necessary to use a light filter or screen; but while it may cut out all the ultra-violet and a portion of the blue, the increased sensitivity of the emulsion to the balance of the spectrum enables a comparatively short exposure to be given. Where, with ortho emulsions, a screen would require an increase in exposure of about twelve to sixteen times, it would only need multiplying by four if a plate or film of the panchromatic variety were chosen instead.

Moreover, the rendering of skies is greatly facilitated, and so great is the difference between No. 4, "Herring Boats, Peel," by J. Thwaites, and the rest on the page, that it would not be surprising to learn that a panchromatic emulsion, suitably screened, had been employed.

Modulation and Values.

The sky, in this case, is full of modulation, and is noticeably darker than the lights of the sunshine on the white paint of the boats in the foreground. This is as it should be, and as it would appear to the eye. The values seem true, and there is no sense of an exaggerated brightness attaching to the sky.

Having regard to the way the sunlight on the boats is rendered, it can be imagined what a gain there would be if, in the case of No. 1, "Homeric," by Miss G. M. Jones, a panchromatic plate or film had been employed. There is a perceptible difference, even now, between the tone of the white paint in sunshine and the blue of the sky against which it comes. It is, however, by no means comparable with either what the eye would see or the way in which it would be presented by a panchromatic emulsion, especially if used with a filter.

Beauty and Effect.

Had this been used, the tone of the sky would be appreciably darker, and the light would glow against it. The effect is one of considerable beauty; it has been very well seen; and it is something of a pity that the photographic rendering has fallen short of what it might have been.

There is, too, an unfortunate fog-marking on the right-hand side, probably arising from allowing the roll of film to become slack when loading or unloading. It is a fault that is easily avoided if precautions are always taken to prevent any such slackness occurring, and this should be done, for, to say the least, it is annoying to find a number of exposures ruined through carelessness in this direction.

There is no real remedy, apart from extensive local retouching, or very careful local extra printing.

"MENTOR."

Pictorial Analysis

Every week one of the pictures reproduced on an art page will be analysed in detail for the benefit of readers of the paper who are seeking to improve their pictorial work.

"GO ON," by Miss M. Eitner.

TO make a satisfactory group of three figures in Indian file—the one following the other—is not an easy task, nor is it one that is attempted with any degree of frequency. The main difficulty is to keep the group coherent, or, perhaps, prevent it from seeming too dissociated; and another factor which provides a task is the adjustment of the relative degree of attraction of each figure, so that, while one is predominant, the others are not relegated into insignificance.

Relative Attraction.

It would obviously be undesirable that each of the three figures should claim an equal share of the attention, nor, in point of fact, would it be easy to accomplish. It would also be unwise, as a general rule, to show one figure so prominently that the other two exerted a negligible pull, for it would then involve a sacrifice of the qualities that a successful grouping affords.

Rather is it preferable that, while each of the figures should be endowed with a differing degree of attraction, one should be just sufficiently more prominent than the others to be decisively the chief; one should be a little less in importance, and the third should just fall short of the interest excited by the second.

That this progression has been achieved in this instance is apparent at a glance at the accompanying sketch. The most important is the leader (1). After him, the girl in the middle (2) takes the second place, while the other girl (3), as the last of the line, becomes the least significant. There are several reasons which account for the figures ranking in this order. In the first place, the direction of movement is upward and from right to left. As the figures occur in succession, the leader of this movement necessarily excites the greatest share of the

attention, the other two appealing in much the same degree as the order in which they appear.

Diagonal Composition.

A similar sense of order is suggested by the degree of contrast which is contained within the outline of each figure. The figure of the boy, with his black trousers and white shirt,

the relative order of attraction, and, besides, plays no small part in suggesting a sense of cohesion. This impression is very considerably aided by the fact that the three elements are shown hand in hand, by which means a real connection—as distinct from one that is imaginary—is established.

The connection so formed enables the figures to be considered as a group and not as a separate collection of divided entities. It co-ordinates the attraction of the three, and, while retaining a sufficiency of individuality in each element as well as the needed order of precedence, enables both the group and the picture as a whole to impart the very necessary suggestion of unity.

Another noteworthy feature of the arrangement of the composition is the reiteration of the diagonal lines, both in the line of the edge of the roof and the verges of the path.

Dominating Lines.

These lines dominate the composition. They make it exceedingly forceful and strong, but, lest they become over-assertive, the lines of the tiling to the right are introduced, and offer enough opposition to prevent any such suggestion. At the same time, they afford a certain sense of support, and, altogether, the composition is admirably managed.

There is just a sufficiency of shadow to make the sunshine evident, and the effect, too, is helped by the dark local colour of the grass in the foreground. The placing of the sunlit parts of the figures against the shadowed part of the wall is clever, and much of the success with which the effect is displayed is attributable to this cause. The work is undeniably well done, and not a little of its charm lies in its *naïveté* and the engaging insouciance of its spontaneous presentation. It is really full of good points.

"MENTOR."

offers a greater measure of contrast than either of the others. Between the two girls, perhaps, there is not so much difference, but No. 2 just seems to have it.

The composition, too, is arranged in the form of a diagonal. It is not very usual, but it is none the less forceful for that, and it has the tendency to direct the attention upwards and emphasise any item which appears at the top. This factor also stresses

November 28th, 1934

NEW BOOKS

that will appeal to the Photographer

"The Kingdom of the Camera," by T. Thorne Baker (G. Bell & Sons, Ltd., York House, Portugal Street, W.C.2, 7s. 6d.). A book that will appeal to every photographer, and also to those who do not practise photography, is this new volume written by Mr. T. Thorne Baker. It strikes a different note from the usual photographic handbook, and is one of Bell's Popular Science series which are issued under the inclusive heading of "Science for the General Reader." This describes it exactly, and Mr. Baker, whose name is well known to our readers as an authority on a variety of photographic subjects, particularly colour photography and emulsion making, has done his task well. The book presents the story of photography to the general reader in a most attractive manner. The story covers a large field and carries the reader pleasantly enough from one topic to another, including journalism, medicine, aviation, industry, crime, engineering, television, photo-micrography, radio-graphy, sound-films, etc., until at last the truth is apparent—that photography is one of the most important factors in the progress of the world to-day. Each of the phases referred to is dealt with in a readable fashion, and while it is in no sense an instruction book, it includes sufficient detail of applied photography to give the general reader a very good idea of each particular process. The book is admirably illustrated, and it is one that can be commended as a volume that will interest everyone who wishes to keep abreast with modern progress. We congratulate Mr. Thorne Baker on the production of this book.

"People I have Shot," by Jarché (Methuen & Co., Ltd., 36, Essex Street, W.C.2, 8s. 6d.). The average newspaper reader to-day is totally unaware how the up-to-the-minute photographic illustrations of current events get into the papers. The fact remains that they are there, and it has become such an everyday occurrence that the absence of pictures relating to topical events would probably be more noticeable than their inclusion. Their presence is largely due to the activities of the ubiquitous Press photographer, of which the author of this book may be regarded as the *doyen*. The amateur free-lance photographer will revel in this book. It is the autobiographical account of the adventures and "scoops" of one of the best-known Press photographers, James Jarché, who was attached to the *Daily Sketch*, and then became the "star" of the *Daily Herald*. The story is told in the most casual and unassuming manner, and makes attractive reading. Incidentally it discloses the amazing lengths to which the "live" pressman goes to secure news pictures at any cost, and

to beat his rivals. The author has led a full life, and describes his work in all parts of the world, and the strange places he has ventured with his camera. It is given with a wealth of anecdote that makes the book at times exciting, and always entertaining. Many of his shots are famous and historical in the annals of illustrated journalism, and it indicates that the successful Press photographer must have an adventurous nature and be untiring in taking risks; his camera must always be ready, and he must have a genius for anticipating events and seizing opportunities. "People I have Shot" is a book that could be taken up and read at any time with interest. It has a characteristic "foreword" by Hannen Swaffer.

"Last of the Wind Ships," by A. J. Villiers (George Routledge and Sons, Ltd., Broadway House, Carter Lane, E.C. 15s.). There are vast numbers of people in this country who love the sea, and to whom pictures of "wind-jammers" make a special appeal. In this volume *de luxe*, Mr. Villiers, who is already well-known for his pictures of this subject, tells his tale afresh and in a more complete form, both as regards matter and illustrations. It is the story of his voyage from Port Victoria, Australia, to Falmouth, round the Horn, and he recounts the record voyage of the four-masted barque *Parma* which covered over 12,000 miles in eighty-three days with a cargo of grain. She was one of the famous ships taking part

in the annual grain race from Australia, and the story is told with a simple charm that will appeal to every reader who likes an authentic book of adventure. Mr. Villiers points out that while in 1921 there were one hundred and forty of these beautiful sailing-ships afloat, barely a score are now available, the rest having disappeared; and he, with everyone who loves sailing-ships, deplors the fact that within ten years they will probably have become extinct. This will mean not only a loss to those who like beautiful things, but a very definite loss to the pictorial photographer whose ambition is to secure a picture of a windjammer at sea. The literary portion of this book, which occupies sixty pages, is admirably written, and is an epic of the sea which in years to come will have real historical value, particularly as the matter is followed with two hundred and eight illustrations which depict the voyage from start to finish with wonderful realism. They show the ship in calm and in storm, and are pictures of great charm and originality. A notable point the author mentions is that practically all the photographs were produced with an old Kodak (120) which he bought from a chemist's assistant in Port Adelaide in 1927 for thirty shillings. It has been four times round the Horn, and is a definite indication that it is the man behind the camera who is responsible for the pictorial results, provided the camera is a reliable working instrument, its cost being a secondary matter. The book concludes with numerous statistics regarding the fleet of ships and their activities since 1927, and refers to Captain Erikson, of Mariehamn, Finland, who is the owner of the majority of those afloat to-day. We can heartily commend this book to every reader who takes an interest in the sea and sailing-ships.

"The A.P." Monthly Competitions

AWARDS FOR OCTOBER.

THE additional activity that was engendered by our Annual Lantern Slide Competition is reflected in the print competition for October. A great number of the subjects that were sent in for lantern slides (and in some cases won prizes) appeared again as prints in the competition. Many of these prints are of high quality, and their producers are to be congratulated on being equally good with both slides and prints. The entries in all three sections were well up to the average, and the awards are as follows:—

ADVANCED WORKERS' SECTION.

First Prize.—"The White Mantle," by John Muller, 53, E. 182nd Street, N.Y.C., N.Y.
Second Prize.—"Cottages Across the Creek," by H. Warwick Nevill, 207, Romford Road, E.7.
Third Prize.—"Thames Side," by Edward H. Brenan, 12, Avenue Rise, Bushey, Herts.
Mounting Prize.—"White Sisters," by Denis Whitlock, 44, Scotts Lane, Shortlands, Kent.
Certificates of Merit.—"Calm Before the Storm," by Edwin Broomer, Glendower, Falkland Road, Torquay; "A Sunlit Doorway," by Hugh Crawford, Kinvara, Castle Park, Belfast; "The Park Gates," by A. I. Fairbank, 11, Copers Cope Road, Beckenham, Kent.

The prints not receiving awards have been grouped, those in the first group receiving Honourable Mention. The others have been marked Class 1, Class 2 and Class 3, respectively.

Those awarded Honourable Mention are as follows: W. J. Allam (London, E.C.); George C. Backhouse (Leeds); L. C. Blanchamp (Putney, S.W.); Edwin Broomer (Torquay); J. H. Clark (Camberwell);

(2) R. W. T. Collins (Worthing); W. T. Dawson (Wallasey); A. I. Fairbank (Beckenham); W. A. Hooker (Great Crosby); William Jackson (Hull); (2) C. W. Johnson (Harrow); Sorab J. Kharegat (Bombay); F. S. Matheson (Cornwall); H. Warwick Nevill (London, E.); Godfrey G. Phillips (Bedford Park); C. W. Rodmell (Hull); Chris. T. Salmon (Barry, Cardiff); A. R. Turpin (London, N.W.).

INTERMEDIATE SECTION.

First Prize.—"Sunshine Alley," by Frederic Finch, Norbreck, Adams Avenue, Tunstall, Stoke-on-Trent.
Second Prize.—"Youth," by G. Newby, 41, Luxor View, Harehills, Leeds.
Certificates of Merit.—"Tête-a-Tête," by Dr. S. D. Jouhar, The Hall, Byers Green, Co. Durham; "Autumn Sun," by G. Tschernochvostoff, 22 A 10, Idrottsgatan, Helsingfors, Finland; "The Night Boat," by H. N. Collinson, 16, Bath Road, Felixstowe; "The Open Shirt," by Fred Sheldermine, Road End, Greenfield, Near Oldham, Lancs.

BEGINNERS' SECTION.

First Prize.—"High Tide," by H. Bailes, 58, Lightwood's Hill, Bearwood, Birmingham.
Second Prize.—"A Labourer's Palace," by Mrs. D. Hall, The Nest, Brixham Road, Paignton, Devon.
Certificates of Merit.—"Wagon Wheels," by Louis Brown, 59, Colwyn Avenue, Derby; "Anne," by Harold Jackson, 1, Cumberland Villas, Egton Street, Hull; "Hammersmith Bridge," by George F. Lockwood, 119, St. John's Road, Walthamstow, E.17; "A Sussex Sentinel," by J. G. Restall, 93, Queen's Road, North End, Portsmouth; "The Fountain," by Jessie Wallace, 2625, Hemlock Street, Vancouver, B.C., Canada.

NEWS AND REVIEWS

ITEMS OF GENERAL INTEREST FROM ALL QUARTERS.

The second highest award in the ninth annual Kodak International Salon of Photography, which was opened in Rochester, U.S.A., to-day, was won by Mr. F. A. Gant, a member of the Kodak staff at Kingsway, London. The Salon, which was founded in England, and is held in a different country each year, is open only to members of the Kodak organisation, and hundreds of entries are received from all parts of the world. The premier award, the Eastman Gold Medal, was won by a Chicago worker, Mr. T. L. J. Bentley, of the Kodak Works at Wealdstone, was awarded a bronze medal, and Messrs. C. L. Clarke and J. Drake, of Kingsway, and Mr. W. Robinson, of Harrow, received certificates.

Camera Club Jubilee.—Following closely upon the heels of the Jubilee of *The Amateur Photographer*, the Camera Club, which was founded in 1885 by the then Editor of "The A.P.," will be celebrated in a "Jubilee Revel" on Saturday, 15th December, at 8 p.m. The Christmas Revels of the Camera Club are already well-established popular annual functions, but to celebrate its fiftieth year the Entertainments Committee is going to make this a very special affair indeed.

The twenty-seventh Salon promoted by the Scottish Photographic Federation will be held in Ayr from 20th April to 4th May, 1935. The Art Galleries of the Carnegie Library and Museum have been secured for the exhibition. No prizes are offered, but a highly successful Art Union (with the sanction of His Majesty's Board of Trade) is promoted, and under its agency many of the pictures exhibited are sold. Customs regulations, however, prohibit the sale of pictures from overseas. The various sections are as follows: (a) Prints, confined to Scottish workers at home

and abroad; (b) Prints, open to all other workers; (c) Lantern Slides, open to all workers; (d) Prints or Slides, of scientific or record interest, open to all workers; (e) Stereoscopic Transparencies, open to all workers. The Judges will be Mr. D. Dunlop, Mr. J. McKissack and Mr. W. W. Weir. The entry forms have now been issued. A postcard to the Salon Secretary, Mr. Arthur J. Nelson, 6, Hilary Crescent, Ayr, will bring an entry form by return.

"Life and Art in Photograph." Messrs. Chatto & Windus (97 and 99, St. Martin's Lane, W.C.2) have just issued three numbers of a new series of books with this general title. Each contains 100 reproductions from photographs, so ably selected that the subject dealt with is presented with extraordinary beauty and completeness. No. 1 is "The Italian Renaissance," with beautiful pictures of typical examples of the architecture, sculpture and painting of this amazing period. No. 2 is "The Polar Regions," an anthology of Arctic and Antarctic photographs of absorbing interest. No. 3 is "A Book of Dogs," in which are portrayed fine specimens of all well-known breeds, interspersed with pictures of hunting, beagling, greyhound-racing, and so on. Each volume is published at five shillings. If other volumes of equal excellence are to follow they will form a series of picture books of rare beauty and interest, and should find an honoured place in every well-ordered home. Incidentally, they provide a forcible object-lesson on the unrivalled merits of photography as a medium of beautiful and accurate pictorial representation.

We regret to have to record the death of Mr. J. A. Heir, who for many years has been chief photographer of Kodak, Ltd. He joined the Company in 1898

and was at first Sales Manager, and then head of the department for all photographic materials for specimen and advertising needs. He was also a painter-artist of considerable merit and his work has been shown in many exhibitions. He was a very popular personality to thousands in the photographic world and will be sincerely missed.

Electric exposure meters have come to stay, and many photographers, both amateur and professional, rely on these ingenious instruments for every exposure made. While certain variations are observable when comparisons are made, there is no doubt that in practical use they afford a very reliable guide. One of the best of the recent examples of these meters is the "Photoskop,"

supplied by Sands Hunter & Co., of 37, Bedford Street, Strand, W.C.2. The appearance of this little instrument is indicated in the illustration herewith, and it will be noted that it is an extremely simple piece of

apparatus free from projections or complications. It is entirely automatic in action, and by pointing it directly at the subject to be photographed the exposure required is indicated by a moving pointer directly on an engraved scale. The only adjustment is to set the scale before use to the speed of plate or film and the stop. The "Photoskop" can be used indoors in dull light or out of doors in brilliant sunshine, and for ciné and artificial light exposures. The price is £5 5s. complete in leather case with full instructions.

The Hackney Photographic Society will hold its 46th Annual Exhibition at the Central Hall, Hackney, from March 27th to 30th, 1935. Entry forms and all particulars are obtainable from the Hon. Secretary, Walter Selfe, 24, Pembury Road, Clapton, E.5.

Exhibitions and Competitions

CURRENT AND FUTURE.

Notices of forthcoming exhibitions and competitions will be included here every week if particulars are sent by the responsible organisers.

The Amateur Photographer Monthly Competitions for Beginners, Intermediate and Advanced Workers.—Entries, November 30. Rules in this issue.

Photographic Society of Ireland, Members' Annual Exhibition.—Open, November 26–December 1. Secretary, A. V. Henry, 34, Lower Beechwood Avenue, Ranelagh, Dublin.

Chicago International Salon.—Open, December 13–January 20. Entry forms from "Salon Committee, Chicago Camera Club, 137, N. Wabash Avenue, Chicago, Ill., U.S.A."

"Northern" Exhibition, City Art Gallery, Manchester.—Open, December 8–January 10. Secretary, J. Chapman, 25, Radstock Road, Stretford, Manchester.

Western International Salon.—Open, December 10–15. Organising Secretary, W. H. Hill-Muchamore, 24, Church Road, Redfield, Bristol, 5.

8th International Christmas Salon of Photography, Antwerp, 1934–35.—Open, December 23, 1934–January 7, 1935. Particulars from Mr. J. Van Dyck, Secretary of the Fotografische Kring "Iris," Ballaerstr., 69, Antwerp, Belgium.

Madrid International Salon.—Entries, December 10. Particulars from the Secretary, Sociedad Fotografica de Madrid, Calle del Principe, 16, Madrid, Spain.

Preston Scientific Society (Photographic Section). Open Exhibition.—Entry forms due January 11; exhibits, January 17; open, January 28–February 16. Secretary, F. Wells, 65, Powis Road, Ashton, Preston, Lancs.

International Miniature Camera Exhibition, for prints and enlargements made from miniature camera negatives.—February 1–27, 1935. Latest date for entries, January 21. Entry forms and particulars from Exhibition Secretary, British Photographic Fellowship, 7, Aberdeen Mansions, Kenton Street, W.C.1.

South London P.S. Annual Exhibition.—Entries, January 22; open, February 16–March 16. Details and entry forms from Hon. Exhibition Secretary, H. S. Adams, 40, Stockwell Park Road, S.W.9.

Leicester and Leicestershire Photographic Society International Exhibition.—Open, February 25–March 2, inclusive. Particulars and entry forms from the Hon. Organising Secretary, W. N. Plant, 30, Harrow Road, Leicester.

Ilford P.S. Annual Exhibition.—Entries, February 2; open, March 4–9. Hon. Exhibition Secretary, H. G. Haylock, 58, Windermere Gardens, Redbridge Lane, Ilford, Essex.

Birmingham P.S. Annual Exhibition.—Entry forms

due, February 9; exhibits, February 12; open, March 2–16. Secretary, E. H. Bellamy, Waterloo House, 20, Waterloo Street, Birmingham.

City of London and Cripplegate P.S. Annual Exhibition.—Closing date, February 11; open, March 11–16. Exhibition Secretary, J. R. P. Hilliard, 86, Downton Avenue, Streatham Hill, S.W.2.

L.M.S. Annual Exhibition.—Entries, February 13; open, March 11–16. Secretary, A. J. Scrivener, Station Master's Office, Euston Station, N.W.1.

Barry C.C. International Salon.—Entries, March 8; open, March 18–23. Secretary, J. H. White, Carleion, 61, Pontypridd Road, Barry, Glam.

Scottish National Salon (Art Galleries, Ayr).—Entries, Overseas, March 9; Great Britain, March 23; open, April 20–May 4. Secretary, Arthur J. Nelson, 6, Hilary Crescent, Ayr, Scotland.

Brussels International Salon.—Entries, March 15; open, May 7–June 9. Secretary, M. Maurice Broquet, Rue du Sceptre, 77, Brussels, Belgium.

Antwerp International Salon.—Entries, March 15; open, April 27–May 12. Secretary, D. J. de Groot, Van Heystrelt-Straat, 19, Deurne-Antwerp, Belgium.

Hackney P.S. Annual Exhibition.—Entries, March 25; open, March 27–30. Secretary, Walter Selfe, 24, Pembury Road, Clapton, E.5.

Amateur Cinematography

Ready for Snow? By R. H. ALDER.

DECEMBER sunshine, thrown back by snow and ice, furnishes ideal lighting for sports scenes. The reflected light gives even illumination, while the low-hung sun provides natural cross-lighting.

Exposure needs careful consideration, particularly as to the range between long and close shots. "Expose for the high-lights and let the shadows take care of themselves" is an excellent motto for reversal film workers, but it is necessary to determine which high-lights form the criterion.

In long shots we are concerned with the play of light and shade on the snow itself. A small aperture will be justified, for there are no expanses of shadow to be clogged up. The reading of a photo-electric meter will need no correction.

The Important Details.

In medium and close shots the high-lights we want to record are those in the features. These are several tones darker than the snow.

Therefore it is not uncommon to find that the stop must be opened up to twice the diameter (half the f/number) required for longer shots—even more in the case of close-ups. By this the snow detail will be lost, but the figures will be correctly rendered.

In such cases both the photo-electric and the extinction meter are carried really close to the main subject, so that the large area of white background is excluded. A meter of any type, however, can be used in the usual position so long as the detail in the actual subject is observed, not that in the surrounding scene.

Colour against Snow.

For the same reason it is essential to use panchromatic stock and a pale filter to cut down the excess of blue light. In summer we have to deal with paler flesh tints against green backgrounds; in winter flushed cheeks are set in lucent white. Ruddy complexions come out unnaturally dark unless there is colour correction as well as adequate exposure.

Much of the sparkle of winter scenes may be lost if the lens-hood is omitted

from the regular equipment. The best type is rectangular, a full inch or more in length, and only just wide enough to avoid cutting the edges of the frame. Without it stray light will cause general fogging which flattens out the delicate detail.

Another cause of flatness is condensation on the lens. Once the camera has been taken out of doors it is not brought into a warm atmosphere until the day's work is done.

The camera-man carries round warmth and moisture himself. Even the felt-lined camera-case is suspect. A clean, dry waterproof square is the best protection for a small camera once it has come out of the house.

Improvisation.

The scenario is generally a mere outline; so much depends on circumstances, and the chances are so brief

that detail must be left to the last moment. For this reason it is as well to plan out beforehand all the possibilities so that the urgency of shooting will not result in unbalanced shots.

Action is predominant always in winter—everyone moves, if only to keep warm. The camera-man must guard, therefore, against a plethora of "busy" shorts without relief.

The editor will want to build a rhythm of alternate movement and pause, so plenty of close-ups of skate-fixing, braziers and similar "semi-stills" may be included.

For tobogganing and skating a distant viewpoint and a telephoto lens are much to be preferred, because they minimise the angular movement of a swing shot. A short-focus shot of a toboggan, with the camera sweeping through nearly 180 degrees, gives a

At work in a film studio. This print will give the amateur some idea of the environment and masses of arc lights required in shooting a modern sequence. It was taken at the B.I.P. Studio, and is an incident in the making of "Radio Parade of 1935," which is being filmed in natural colours by the Dufaycolor process.

terrific impression of speed, but on the screen the sledge appears to take a sharp bend without any banking to help it.

Swing Shots.

One such unnatural shot will pass, but for the rest, if a short-focus lens only is available, it is better to rely

on fixed angles at the top and bottom of the hill. If there is a tricky bit of banking in the course of the run it is worth while to spend a few feet there in the hope of a spill.

Figure-skating is pre-eminently a subject for slow motion, if the light is good enough. One or two such shots, cut into the middle of some

swift work on the outside edge, will always provoke enthusiasm in the audience.

Finally, don't forget the possibilities of the thaw. A dripping icicle or a crumbling snow-man (if you are lucky enough to get him at the psychological moment) forms an effective fade-out.

Leads and Connections with the Household Mains

By
"ACTINOGRAPHER."

MODERN lighting equipment is so very efficient in itself that the majority of failures experienced can be traced down to faulty connections and other external factors.

One of the most puzzling of these failures is due to a "dead" point in the household mains system. Points may go dead for a variety of reasons that do not concern us here—although it is unfortunate that the fact is not often discovered until the lights or projectors have been connected up in readiness for working.

In most cases, it is a waste of time to attempt any remedies on the spot. The utmost that can be done is to test the point by directly plugging-in a lamp or another piece of apparatus, at the same time checking over the switch controls. Should the point prove to be in good order, connections to the original apparatus must be checked over; but should current still prove unobtainable no time should be lost in plugging into another mains point.

Losses.

In changing over from one point

to another, it may be necessary to use leads longer than those ordinarily employed. This may result in some loss of brilliancy or power—since very long leads always cause an appreciable drop in the voltage.

One remedy for this is to readjust the resistance, though it must be remembered that (as the apparatus is probably being overrun already) a lower voltage may be preferable to an excessive one.

Fluctuations.

Mains current may also tend to fluctuate apart from any of these considerations. During "business hours" in London, for example, it has been found impossible to approach within 10 volts of the normal rating; and *after* business hours an excess of 20 volts has been noted. Obviously, then, to adjust the resistance for the deficiency would lead to disastrous results if a further adjustment were not made to counter the increased pressure of 30 volts.

Many circuits can be overrun—some by 100 per cent or more—but this factor must be regarded as a safety valve and should never be assumed. For this

reason it is best to detach the plugs of electric fires, irons and other devices on the same circuit before drawing off the fairly heavy current required for ciné apparatus.

Avoiding Breakdowns.

All connecting fittings should be properly attached to their respective leads, since loose contacts are dangerous and are not always easy to find. In use, the leads themselves should be placed out of harm's way beneath carpets, etc., or clipped against the wall.

These things always appear rather simple when considered in a detached kind of way, but in actual practice they are often prone to assume troublesome dimensions. Perhaps the safest way to avoid breakdowns is to detail one person in particular charge of connections, leads, switches, etc. The fact that no other duties are assigned to him will show that there is all the difference in the world between such an arrangement and the confusion that occasionally arises when no real plans are made in preparing for a home ciné show.

ACTION SUBJECTS for the AMATEUR CINEMATOGRAPHER

The Amateur Photographer and Cinematographer's Diary of Forthcoming Events.

FORTHCOMING EVENTS DURING DECEMBER, 1934.

| DATE. | EVENT. | PLACE. | DATE. | EVENT. | PLACE. |

| " 25. | Christmas Day. | | | Bonfire at Cross Knowe (burning out the Old Year) | Biggar. |
| | Ancient customs: Mediaeval Plays by Christmas "mummers" in Hampshire; "Guise Dancing" at St. Ives, Cornwall; The Holy Thorn Festival of Flowers at Glastonbury, Somerset, and Nativity Plays at St. Hilary, Cornwall, and Glastonbury. | | DURING THE MONTH. | Scottish National Fat Stock Show | Edinburgh. |
| | | | | Oxford v. Cambridge (Rugby) | Twickenham. |

The Week's Meetings

Societies will have their meetings announced here if the syllabus is sent to us at the beginning of the session or from time to time.

Wednesday, November 28th.

Bethnal Green C.C. "Using the Club's Enlarger." J. Hendy.
Birkenhead P.A. Lecturettes by Members.
Birmingham P.S. (Ciné Section). Demonstrations on Sound-Film Equipment by Mr. Buckland (B.T.H. Co.).
Borough Poly. P.S. "Photomicrography." J. G. Miller.
Brighton and Hove C.C. Bromide Demonstration. F. Burfield Dyer.
Bristol P.S. "Night Photography."
Camberwell C.C. "The Beginner's Problems with an Enlarger." R. C. L. Herdson.
Chorley P.S. L. and C.P.U. Prints.
Coventry P.C. "Highways and Byways in Shakespeare's Land." Wm. A. Clark.
Croydon C.C. Print and Transparencies Competition.
Darwen P.A. "Titles—Suitable and Unsuitable." John White.
Dennistoun A.P.A. G.D.U. and S.P.F. Portfolios.
G.E. Mechanics Inst. P.S. Competition.
Handsworth P.S. "It Didn't Get There." R. T. Newman.
Ilford P.S. "Autolycus in East Anglia." G. E. W. Herbert.
L.M.S. (London) P.S. Slide-Making. H. W. Bennett.
Northallerton and D.P.S. "The Amateur Photographer" Prize Slides.
Partick C.C. G.D.U. and S.P.F. Slides.
South Suburban and C.P.S. "Colour Photography." F. P. Bayne.

Thursday, November 29th.

Accrington C.C. The Chloro-Bromide Process. Mr. Egan.
Ashton-under-Lyne P.S. "My Methods." G. J. Brown.
Aston P.S. Alliance Slides.
Bury P.S. "Bird Hunting with a Tramp." Rennie Woods.
Coatbridge P.A. "Mounting of Prints." E. C. Shaw.
Gateshead and D.C.C. "The Land of Sunshine." T. Charlton.
Gravesend and D.P.S. Alliance Slides.
Greenock C.C. Sashalite. J. C. Tannock.
Hammersmith H.H.P.S. "Photography in the Detection of Forgery." T. J. Ward.
Hull P.S. Criticism of Members' Prints. S. Bridgen.
Isle of Wight C.C. Cinema Films.
Keighley and D.P.A. "Cave Exploration in Yorkshire." H. W. Haywood.
Liverpool A.P.A. "Sailing Ship Days." Rev. S. Bradford.
Loughborough P.S. Slide-Making. J. O. Wilkes.
Newcastle and D.A.C.A. Films by Finchley A.C.S. and Wood House Pictures.
N. Middlesex P.S. "Lighting in Portraiture." Miss D. M. Woollons.
Oldham P.S. Monthly Meeting.
Richmond C.C. "Snapshots in Colour." H. Nelson Clarke.
St. Helens C.C. Exhibition.
Sheffield P.S. "Oxford: its Colleges and University Life." C. W. Rodmell.
Singer C.C. G.D.U. and S.P.F. Slides.
Stourbridge Inst. P.S. "Dark-room Dodges." G. C. Weston.
Twickenham P.S. "From Plate to Print." A. S. Farris.
Tynemouth P.S. Slide-Making. J. N. Lilley.
Watford C.C. Lecturette Evening.
Wimbledon C.C. "A Little Holiday in France." G. E. W. Herbert.
Woolwich P.S. "The Amateur Photographer" Prize Slides.

Friday, November 30th.

Bethnal Green C.C. "Photography and the Commercial Artist." F. H. Fradd.
Hackney P.S. National Gallery.
Harrogate P.S. "A Chat on Plates and Films." S. Bridgen.
Hinckley and D.P.S. Bromide Enlarging. T. H. Woodward.
John Ruskin C.C. Lenses and Shutters.
King's Heath P.S. "Norway, a Peep at Folk and Fjords." F. W. Pilditch.
Leigh Lit. Society P.S. "Colouring Slides." R. P. Battersby.
Leytonstone and Wanstead C.C. "London's Cup of Tea." G. W. L. Carter.
Royal P.S. Projection of Films in Connection with Cinematography Exhibition.
St. Helens C.C. Exhibition.
Sheffield P.S. "English Gothic Architecture." R. Nicols.
Shropshire C.C. "Common Faults in Handling a Camera." M. F. Thatcher.
Southend-on-Sea and D.P.S. Enlarged Paper Negatives. G. Crosby.
Wimbledon Ciné Club. Programme of Films by Seall F.S.

Saturday, December 1st.

St. Helens C.C. Exhibition.
Sheffield P.S. "Land of the Moors." J. C. North.

Monday, December 3rd.

Ashington and Hirst P.C. Copying. J. Crudace.
Blackpool and Fylde P.S. Open Night.
Bradford P.S. Lecturette Evening.
Chelsea P.S. "Home Portraiture." F. P. Bayne.
City of London and C.P.S. Slides by Contact and Reduction. J. E. Phillips.
Derby P.S. Bromide and Warm-toned Papers. H. R. Kershaw.
Dewsbury P.S. Alliance Prints.
Erdington and D.P.S. "The Amateur Photographer" Prize Slides.
Glasgow and W.S.P.A. Paper Negatives. James Thompson.
Gravesend and D.P.S. Practical Mounting. W. H. Banyard.
Hammersmith H.H.P.S. (Stereo and Colour Group). "Light Filters." J. A. Hall.
Ipswich and D.P.S. E.A.F. Slides and Prints.
Kidderminster and D.P.S. "Preparing the Exhibition Print." Fred Green.

Monday, December 3rd (contd.).

Kingston-upon-Thames and D.P.S. "The Mediaeval Church." E. Yates.
Leeds C.C. "Plates and Films." S. Bridgen.
Leeds University P.S. "Colour and Critics." C. F. Walker.
London County Council Staff C.C. "Art and the Camera." W. L. Shand.
Luton and D.C.C. "Romantic Italy." Alex. Keighley.

An International Miniature Camera Exhibition.—In keeping with the great increase of miniature cameras amongst photographers to-day, the British Photographic Fellowship is holding an exhibition of work from these small-sized instruments in February next, in London.

All miniature workers, both British and foreign, are invited to submit their efforts for this open show, which is to be held at Foyle's Gallery in Charing Cross Road, from the 1st to 21st of February, 1935. The largest sized negative that is eligible for this show is

2½ × 2½ in., and all enlarging must be the work of the author. The last date for entries is January 21st, and forms may be had from the Exhibition Secretary, B.P.F., 7, Aberdeen Mansions, Kenton Street, London, W.C.1, upon receipt of a stamp.

Readers' Questions ANSWERED

GENERAL.—All communications for the Editor should be addressed: "The Editor, *The Amateur Photographer and Cinematographer*, Dorset House, Stamford Street, London, S.E.1," and in every case, without exception, must give the name and address of the writer.

CONTRIBUTIONS.—The Editor is glad to consider original, up-to-date manuscripts on photographic subjects. All contributions must be typewritten, or in very legible handwriting on one side of the paper only. Letters or communications arising out of matters already appearing in the paper are not paid for. The Editor disclaims legal responsibility for the safety of matter submitted to him, but he will endeavour to return rejected manuscripts, etc., when a stamped addressed envelope is enclosed. MSS. or prints that are not actually accompanied by a stamped wrapper or envelope can in no case be returned. Reproduction fees for prints are only paid by arrangement beforehand. The sending of a print, without any condition stated, will be taken as permission to reproduce it without fee.

ENQUIRIES AND CRITICISM.—Advice, Criticism and Information are freely given, but the following conditions should be read carefully before applying, as any communication which does not comply with the rules must be ignored.

(1) See "General" above. (2) Every question and every print for criticism must be sent separately through the post, and must be accompanied by a separate stamped addressed envelope. No exception can be made in any case to this rule, except so far as enquiries or prints from Overseas are concerned. (3) Neither enquiries nor prints for criticism must be enclosed with competition prints. (4) On the back of each print sent for criticism, in addition to the name and address of the sender, must be the title (if any), and the criticism coupon from the current issue. (5) Enquiries should be clearly written, on one side of the paper only, and should be specific and not general. Such enquiries as "How can I take interiors?" or "Can you give me some hints on outdoor portraiture?" are too general to be dealt with in this section. (6) All envelopes should be distinctly marked "Query" or "Criticism," as the case may be. (7) Prints are sent for advice or criticism on the distinct understanding that by so doing permission is given for their reproduction without fee. We endeavour to deal promptly with enquiries, but cannot undertake to answer by return of post, nor can we give precedence to any enquiry.

A selection of those replies is printed each week, but all questions are answered by post. Enquiries from abroad must contain a coupon also, but it need not be from the current number, and should be cut from the latest issue to reach the enquiry.

Sluggish Shutter.

The blind of my focal-plane shutter does not run right down on the slow speeds. Could you advise me?
R. V. E. (Reading.)

It is pretty evident from your description that the shutter wants overhauling, as such shutters always do at intervals. Any of the good repairers advertising in our columns would do the work, and if necessary quote a price beforehand.

Free-Lance Work.

I wish to take up photography in connection with free-lance journalism, and am told that a half-plate camera is best for the purpose. Is this so? I have little knowledge of photography, so would you tell me what books to buy, or would it be better to advertise for lessons?
M. P. (Sunderland.)

There is not the slightest need to use a half-plate camera for the purpose you name, and it would be very expensive to run. As you have little knowledge of photography you will stand a poor chance of succeeding with free-lance work, the competition in which is already very keen. We think your best plan would be to obtain through a dealer a copy of "Free-Lance Journalism with a Camera," by Rufus Mallinson, which is published at 3s. 6d. You would then get an idea as to what is required for such work.

Transfer Paper.

How can one prepare transfer paper for the Carbro process?
W. H. L. (London.)

If you care to experiment in preparing the final support papers you might proceed as follows: Soak 1 oz. of Nelson's gelatine in 20 oz. of water for an hour or so, and then dissolve by gentle heat. When solution is complete add gradually 12 grains of chrome alum dissolved in 1 oz. of water. This is then applied to the paper, either by floating or by means of a Blanchard brush.

Reproduction.

I have sold a photograph for reproduction as a birthday card, but not the sole rights. Can I offer the same photograph to other similar firms?
E. C. C. (Norbury.)

As your receipt says that the payment was for reproduction rights and not for sole reproduction rights there appears to be no reason why you should not offer the same subject to other firms. At the same time, there are few firms that would accept a photograph for reproduction if they were aware that it was being used by other firms as well, and it would be only fair to notify them of the fact at any rate.

Negative Failures.

I have a number of negatives showing curious markings as in the foliage of the enclosed specimen. The film is Agfa Isochrom, the exposure 1/15th at f/11, obtained from a Practos meter. All the films in question were taken on clear hot days between September 9th-16th. Selochrome film also shows the same marking. Films were developed by time and temperature in either Rytol or pyro-metol, about 14-20 days after taking. Camera, Ensign 1/2-plate reflex, Triotar f/4.5 lens. Can you account for the puzzling results?
L. H. B. (Neasden.)

The explanation of the trouble with your negatives is a very simple one; it is due to considerable movement of the camera during exposure.

Backing for Plates.

Can you tell me how to prepare a plate-backing for home application?
W. W. (Bath.)

There are many such preparations, but the choice of one depends to some extent on the kind of plate to be backed. You should refer to such a textbook as the "Dictionary of Photography" for recipes and the method of preparing them. You will find the backing of the plates rather "messy," and somewhat risky unless you have proper facilities for the purpose. On the whole, it is better to depend on commercially backed plates, as the extra cost is small.

Wynne Meter.

Among some odds and ends I bought is a Wynne meter, but I am at a loss as to speed numbers, etc. Can you give me an idea as to how to use it?
B. E. L. (Cardiff.)

You must get the little instruction book which should accompany the meter, and in which the speed rating is explained. You will probably also require a fresh supply of sensitive paper. Address: The Infalible Exposure Meter Co., Wrexham.

Bichromate Stain.

How can I expedite the removal of bichromate stain when intensifying negatives?
S. E. (London.)

After a preliminary washing immerse the negatives in a 5 per cent solution of potassium metabisulphite, and then wash again.

Blotting-Paper.

Is ordinary white blotting-paper suitable for putting prints between to dry?
L. L. F. (Norbury.)

You should on no account use ordinary blotting-paper even for surface drying the prints, and in any case it is not advisable to leave prints between paper at all. They should be freely exposed to air, so that they dry quickly. Any photographic dealer can obtain the right sort of blotting-paper for you; it is stout, absorbent and fluffless.

Iodine for Bromides.

How is iodine used for clearing up foggy and degraded bromide prints?
S. E. M. (London.)

Dissolve 30 grs. of potassium iodide in 10 oz. of water, and add 3 grs. of metallic iodine flakes. Soak the print first, and then pour the iodine solution over it, keeping the dish rocking gently. Presently the high-lights will turn blue. Rinse the print, fix in plain hypo, and wash thoroughly. Care must be taken, or the lightest tones, as well as the fog, will disappear.

Anhydrous Salts.

Will you explain why the weights of anhydrous salts used are different from the weights of corresponding crystals?
F. J. (Boston.)

Part of the weight of crystals is what is called water of crystallisation, the quantity of which varies. This water is absent in the anhydrous forms, which are therefore "stronger."

Wall for Projection.

I wish to prepare a portion of a wall (plastered) for projecting cine films. What kind of distemper would you advise?
S. I. B. (Exeter.)

We should not advise distemper at all. We suggest that you first apply a coat of strong size, followed later by a coat of white lead priming. Finally give two coats, at intervals, of flat (not glossy) white paint. This can be cleaned down from time to time with warm water and a sponge, and will wear better than distemper.

Blacking Iris.

The blades of an iris diaphragm have worn bright in parts; how can I black them?
H. R. (Lancaster.)

We strongly advise you to have the work done by a qualified repairer. It is no task for the novice, as you will soon find if you attempt it.

The new volume of "Photograms of the Year" for 1935 now in the press, to be published early in December, reflects the wide range of subjects which the present-day photographer brings within the scope of his art. Every lover of charming pictures should make sure of obtaining a copy of this collection of masterpieces from the world's foremost camera artists.

Orders in advance with remittance should be forwarded to the Publishers

ILIFFE & SONS LTD., DORSET HOUSE, STAMFORD STREET, LONDON, S.E.1

READY EARLY IN DECEMBER

The AMATEUR'S EMPORIUM

Business Notices Publishing

OFFICES.—Dorset House, Stamford Street, London, S.E.1. Telegrams: "Amaphot, Watloo, London." Telephone: Hop 3333 (50 lines).
PUBLISHING DATE.—"The Amateur Photographer and Cinematographer" is on sale throughout the United Kingdom every Wednesday morning.
SUBSCRIPTION RATES.—British Isles 17/4 per annum, Canada 17/4, other countries abroad 19/8 per annum, post free.
REMITTANCES.—Cheques, etc., should be crossed and made payable to Illiffe and Sons Ltd.

Displayed Advertisements

Communications on Advertisement matters should be addressed: The Advertisement Manager, "The Amateur Photographer and Cinematographer," Dorset House, Stamford Street, London, S.E.1. Copy for displayed advertisements for the issue of any particular week must reach Dorset House by the first post on Tuesday morning in the week previous. Rates and conditions will be sent upon application.

Prepaid Advertisements

SALE AND EXCHANGE: AMATEURS ONLY—
 12 words or less: 1/-
 1d. for every additional word.
PROFESSIONAL AND TRADE:—
 12 words or less: 2/3
 2d. for every additional word.

Each paragraph is charged separately.
SERIES DISCOUNTS are allowed to Trade Advertisers as follows on orders for consecutive insertions, provided a contract is placed in advance, and in the absence of fresh instructions the entire "copy" is repeated from the previous issue: 13 consecutive insertions, 5%; 26 consecutive, 10%; 52 consecutive, 15%.
 All advertisements inserted in these columns must be strictly prepaid and posted to arrive at the Head Office, Dorset House, Stamford Street, S.E.1, not later than first post FRIDAY for the following week's issue, or one day earlier at the Branch Offices, 19, Hertford Street, Coventry; Guildhall Buildings, Navigation Street, Birmingham, 2; 260, Deansgate, Manchester, 2; 25b, Renfield Street, Glasgow, C.2.
 Advertisements are inserted, as far as possible, in the order received, and those received too late for one issue, or crowded out, are published in the first following in which there is space. The Proprietors retain the right to refuse or withdraw advertisements at their discretion.

Postal Orders sent in payment for Advertisements should be made payable to ILLIFFE AND SONS LTD., and crossed

& Co.

Notes being untraceable if lost in transit should not be sent as remittances.

The Proprietors are not responsible for clerical or printer's errors, although every care is taken to avoid mistakes.

BOX NUMBERS.—For the convenience of advertisers, letters may be addressed to numbers at the office of this paper. When this is desired, the sum of 6d. to defray the cost of registration and to cover postage on replies must be added to the advertisement charges, which must include the words "Box 000, c/o 'The Amateur Photographer'." Replies should be addressed: "Box 000, c/o 'The Amateur Photographer,' Dorset House, Stamford Street, London, S.E.1," and these letters will be simply forwarded by us to the advertiser. It must be understood that we do not deal with the correspondence in any other way, nor accept any responsibility in connection with the advertisement. Readers who reply to Box No. advertisements are warned against sending remittances through the post except in registered envelopes. In all such cases the use of the "Deposit System" is recommended.

Special Note

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post. When sending remittances direct to an advertiser, stamp for return should also be included for use in the event of the application proving unsuccessful.

Deposit System

Readers who hesitate to send money to advertisers in these columns may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Amateur Photographer and Cinematographer," both parties are advised of its receipt. The time allowed for decision is three days, counting from receipt of goods, after which period, if buyer decides not to retain goods, they must be returned to sender. If a sale is effected, buyer instructs us to remit amount to seller, but if not, seller instructs us to return amount to depositor. Carriage is paid by the buyer, but in the event of no sale, and subject to there being no different arrangement between buyer and seller, each pays carriage one way. The seller takes the risk of loss or damage in transit, for which we take no responsibility. For all transactions up to £10 a deposit fee of 1/- is charged; on transactions over £10 and under £50 the fee is 2/6; over £50 and under £75, 5/-; over £75 and under £100, 7/8; and on all transactions over £100, one-half per cent. All deposit matters are dealt with at Dorset House, Stamford Street, London, S.E.1, and cheques and money orders should be made payable to Illiffe and Sons Ltd.

CAMERAS AND LENSES

UNUSOLD Rolleiflex 2½×2½, f/3.8 Tessar, automatic model, leather case, pair Proxars, filter; cost £26; accept £20; bargain; deposit system.—Box 2174, c/o "The Amateur Photographer." [4543]

1-PLATE Goerz Tenax Double Extension, f/6.3, 4 Compur, 1 to 1/250th sec., slides, case, £3 or nearest.—Day, 26, Currock Rd., Carlisle. [4649]

WARNING

We have received many complaints from our readers in regard to the business methods of Mr. R. L. Green, trading as R. L. Green's Photographic Exchange, of 218, Fore Street, Edmonton, London, N.18.

For some considerable time we have refused to insert his advertisements in "The Amateur Photographer and Cinematographer," and from the complaints we have received it would appear that his practice is to communicate with private advertisers having goods for sale, offering to take such goods in exchange for others, or to purchase for cash. Readers are advised to ignore all such offers from this quarter.

CAMERAS AND LENSES

POSTCARD Outfit, perfect, cost over £26. 10×15 cm. and P.C. Zeiss Ikon Folding D.E. Maximar Camera, Zeiss Tessar f/4.5, Compur, £21/2/6; Six Slides with P.C. Compur shutter, £18/15.

DEFERRED Payments are arranged upon the following scale in approved cases: 20 per cent of the value of purchase at the commencement of transaction, the balance over a period of from 6 to 12 months as arranged. Two references required, either householders, employer or bank. With instruments purchased in part exchange the difference in value is considered the purchase price.

WHERE these arrangements are complied with there will be no addition in the purchase price for deferred payments.

NO Sale Lists issued; enquiries by post will receive prompt and careful attention.

EXCEPTIONAL Deferred Payment Terms; Repairs by experienced workmen; estimates free by return post.

DEVELOPING, Printing and Enlarging, our speciality; best possible results guaranteed; quick service.

NEGRETTE and **ZAMBRA**, 122, Regent St., W.1. [0010]

THIRD EDITION

MOTION PICTURES

with the Baby Ciné

A Handbook on 9.5-mm.
 Cinematography

By

HAROLD B. ABBOTT

This handbook, specially written for amateur cinematographers, includes every aspect of the fascinating hobby of making motion pictures.

In the preparation of this third edition a thorough revision has been carried out. Much additional information has been included, and all important new apparatus has been brought under review.

The following Table of Contents indicates the wide range of the book and the completeness with which the subject is covered.

THE PRINCIPLES OF CINEMATOGRAPHY.

"PHOTOSKOP"

The New Electric Exposure Meter

The Photoskop is entirely automatic and in no way dependent on the human factor. Unlike other electric exposure meters, the Photoskop indicates the exposure directly without reference to tables and without any calculations.

HAND CAMERAS

Third
Edition

By R. Child Bayley

AN outstanding feature of this book, which makes a special appeal to all amateur photographers, is a number of separately printed plates, all from hand camera negatives by the author. These are selected to show the very wide range of subjects accessible to the snapshotter, from pure landscape to tele-photographic portraiture.

Though primarily written for the beginner, "Hand Cameras" contains much of interest to the advanced worker, and should be in the working library of all who would attain to the highest degree of artistic excellence in their work.

...and you do Best of All at Wallace Heaton's

WESTON METERS

MODEL 617/2 (as illustrated). The universal meter for "still" or "ciné" work. Built on the photoelectric light cell system. Absolutely foolproof. **£11**

Model 627. A small, handy Weston meter for ciné work only. **£8 : 10 : 0**
Nine monthly payments of 25s 8 or 19 10.

LEICA MODEL III

with f2 SUMMAR LENS in collapsible mount. Gives exposures of 1, 1/2 and 1/4 sec., or any intermediate fraction, in addition to 1/20th-1/500th sec. Automatic focussing. Measuring distance and focussing lens in a single action. **£35 : 5 : 0**

Nine monthly payments of 82 3.

CHOOSE YOUR XMAS GIFTS FROM WALLACE HEATON'S CATALOGUES

Not four weeks to Xmas—why not choose your gifts now and be in time? We have the finest selection of 'still' and ciné suggestions it is possible to find throughout the length and breadth of the country.

We have five free lists—one each for 'still' apparatus, ciné apparatus, used bargains, sundries and film library. Send 2d. postage now to Dept. A for any or all you require. Send at once—don't leave the gift problem until the last moment.

FIRST PAYMENT SECURES ANY PURCHASE

Pay for it while enjoying its full use.

'OMBRUX' METER

For all 'still' photography. No batteries. Works on photoelectric system. Gives direct readings under practically all lighting conditions. **£4 : 4 : 0**

'BLENDUX' for ciné work. **£4 : 4 : 0**

Nine monthly payments of 9 11.

SUPER IKONTA '530'

Zeiss Ikon's latest entry into the field of miniature cameras—and it's a sure winner. It does the focussing itself. Fitted with coupled distance meter. Takes 16 photos on 31/2 x 2 1/4 roll film. With Zeiss Tessar f3.5 lens and Compur shutter.

£16 : 12 : 6

Nine monthly payments of 35 10.

IKONTA, BABY IKONTA AND ALL ZEISS IKON MODELS

AUTOMATIC 'ROLLEIFLEX'

Makes sure of your subject at every shot. What you see on the ground-glass screen you get in exact detail on your picture. Parallax compensation ensures that no vital points of the picture are "chopped off." Rolleiflex takes 12 pictures on 3 1/2 x 2 1/4 roll film. Fitted with Compur shutter and Zeiss Tessar f4.5 lens. **£20**

Nine monthly payments of 46 8.

Zeiss Tessar f2.8, £22 19s. 0d.

FILM LIBRARY!

In addition to our usual comprehensive range of films, we have added hundreds more titles exclusive to Wallace Heaton customers. It is now as cheap to hire them by post as to get them at our shop, as the period taken in post is deducted from cost. Send for details.

FILMO J.S.

With 750-watt illumination. Here is the projector to make you proud of your films. It will show them to better advantage than any other.

The world's best home cine. **£84**

Nine monthly payments of 19 19s. 0d.

FOCOMAT ENLARGER

Specially made for Leica enlarging. Has automatic focussing, and enables you to make perfect pictures up to any size from 3 1/2 x 2 1/4 to 15 x 10 in. Diffused illumination gives soft, harmonious enlargements.

For use with your own Leica lens.

£13 : 19 : 0

Nine monthly payments of 32 7.

EASY TERMS AND EXCHANGES!

Any item on 9 equal monthly instalments. First payment secures your purchase. We pay generous allowances on your used still or cine apparatus in part exchange for something better. Get in touch with us and save money this way.

PATHE '200-B' PROJECTOR

With 200-watt lighting. Picture 10 ft. wide easily obtainable. Flickerless projection, sprocket-fed. Works off 110 volts. With lamp, plug, flex, adapter and one empty 300-ft. super reel. **£15**

Nine monthly payments of 35 -.

ENSIGN '300-B' PROJECTOR

The Real Father Christmas

ENSIGN

"SILVER MIDGET"

Ideal Christmas Gift

Price **33/-**

Anastigmat Model **55/-**

Ensign, Limited, High Holborn, London, W.C.1

Kodak *bring down the cost* of *Miniature Camera Photography*

HERE is a Miniature Camera that takes 36 exposures at a single loading on 35 mm. Film—has a fast Schneider “Xenar” $f3.5$ Anastigmat Lens in a “Compur” Shutter (1-1/300th Second) and sells for only £10-10-0 — an astonishingly low price for this type of high-precision apparatus.

The “Retina”

KODAK'S LATEST PRODUCT

£10.10.0

36 EXPOSURES FOR 3/6

Picture size 36 x 24 mm. (approximately 1½" x 1"). Two famous Kodak grades are available for the “Retina.”—“Panatomic” Film—Superfine grain, panchromatic, fast to daylight, relatively faster still to artificial light. Kodak Super Sensitive Panchromatic Film—the film of lightning speed, fast to daylight and, because of its high red sensitivity, extremely fast indeed to artificial light.

Look at the leading Features and Fittings—then think of all the fascinating pictures you could take with a “Retina.”

- Schneider Xenar $f3.5$ Anastigmat Lens. ● “Compur” Shutter. ● Optical View Finder. ● Automatic Exposure Counter. ● Depth of Focus Scale.
- Daylight loading and unloading with new Kodak 35 mm. Cassette.

Ask for the free illustrated “Retina” Booklet.

SUGGESTIONS FOR CHRISTMAS

ALTRINCHAM **THE THORNTON-PICKARD** ENGLAND

T.-P. COMPOUND MAGNIFIERS MAKE CRITICAL FOCUSING EASY

They give a large magnified image of the picture on the screen, and permit the finest adjustment of the lens.

They are optically paired to give a single image and do not strain the eyes.

They are suitable for most sights, and should be in every reflex worker's kit.

IKOFLEX ZEISS IKON TWIN LENS REFLEX

*The New Wonder
in the Camera World*

- (1) Full size view-finder.
- (2) Efficiently hooded. Magnifying condenser under ground glass gives an extremely bright image even in the corners, and—
- (3) High-power magnifying lens in addition, to facilitate exact focussing.
- (4) Depth of focus scale.
- (5) Large finder anastigmat giving perfect definition.
- (6) Lever focussing actuating both finder and taking lens.
- (7) Automatic film winding.
- (8) Novar f/4.5 in Ikoflex shutter.

Price £7 : 10 : 0

The Ikoflex takes 12 exposures on the usual $3\frac{1}{4} \times 2\frac{1}{4}$ in. 8-exposure spool.

A descriptive illustrated folder will be sent free on application, or can be obtained from your dealer. All good dealers have stock of the Ikoflex.

GET IT AT "THE WESTMINSTER" YOU CANNOT DO BETTER

The Leitz 'FOCOMAT' ENLARGER

With Automatic Focusing.
Takes the standard 5-cm. focus Leica lens, screw-in fitting, automatic focusing adjustment, scaled from 2 diameters up to 10 diameters. Will take negatives 18x25 mm., 24x36 mm., 3x4 cm., and 4x4 cm. Metal masks can be supplied for any of these sizes.

(Write for Leaflet.)

£13:19 0

Nine monthly payments of 32/7.

LEICA MODEL III

With F/2 Summar in Collapsible Mount.

Self-capping focal-plane shutter, speeds 1 to 1/500th sec., T. and B., automatic focusing, interchangeable lens mount, chromium plated. **£35:5:0**
Nine monthly payments of 82/3. **£27:0:0**
Fitted with f/3.5 Elmar anastigmat. **£27:0:0**
Nine monthly payments of 63/-.

The Multi-Speed EXAKTA

Self-capping focal-plane shutter, speeds 12 secs. to 1/1,000th, T. and B., delayed action, 1/10th to 6 secs.

Fitted f/2.8 Zeiss Tessar anastigmat, metal focussing hood, with magnifier, simple focussing, 3 ft. to infinity. Takes standard V.P. films. Double exposures an impossibility. **£26:0:0**
Nine monthly payments of 60/8.

PATHÉSCOPE 200-B PROJECTOR

9.5-mm.

OUTSTANDING FEATURES:

Fitted with highly efficient 250-watt direct lighting system, giving a brilliant screen picture 10 ft. wide. Flickerless projection. Very compact. Fan-cooled and asbestos-lined lamp-house. Simple threading. Universal tilting movement. Motor rewind for use on A.C. or D.C. supply, complete with lamp and motor drive for use on any voltage from 200 to 250 volts. 300-ft. empty reel and flex. Please state voltage when ordering. **£15:0:0**
Nine monthly payments of 35/-.

THE DEKKO

The New DEKKO 9.5-mm.
Hand-driven Projector.

Exceptional balance, silence and long life, due to the introduction of spiral gears and bronze bearings. Cast metal base for solidity and steadiness. The resistance is housed in this base, suitable for voltages from 110 to 250. Aluminium lamp-house designed to dissipate heat. Double the illumination of similar models, invaluable for dark and under-exposed films. New type of shutter between the lamp and film to eliminate burning and buckling of the film. Simplicity of threading and rewinding. Attractive appearance and finish. Price.... **65/-**

Complete with Lamp and Resistance.
Carrying-case, 5/- extra.

VOL. LXXVIII. No. 2404.

THE Christmas Number of *The Amateur Photographer*, which will be published next week, will be more than a special issue containing extra pages of pictures and reading matter; it will be a Christmas Presents Number. Every year the problem of the Christmas present becomes more difficult to solve. But every year there is ample proof that the number of amateur photographers and others who are interested in photography has increased to an amazing extent. To all these a present that is photographic in character will appeal, and one of the functions of "The A.P." Christmas Number is to supply just that information and guidance that will render the path of the present-giver an easy one. Photographic gifts of all sorts, and to suit all pockets, will be described and illustrated in the course of many pages in this issue. At the same time, the other features that have made "The A.P." Christmas Numbers so popular and attractive in the past will not be overlooked. The number will be well worth getting, and readers should make sure of getting it early. It will be published on Wednesday next, December 12th.

Modern Photography.

Slowly but surely the various impediments that hampered the camera worker of the past are being overcome; the modern Press photographer is but one of those who owe a debt of gratitude to the clever work of the chemist and experimenter in the service of the photographic manufacturer. In the search for speed and then still more speed, other attributes for perfection are being attained. In carrying panchromatism to its extreme, infra-red photography has benefited, and

TOPICS of the Week

Fog.

A typical winter day in Town, with great pictorial possibilities. To make the most of such subjects if the fog effect is to be retained, the fastest non-pan. plates or films should be used without a filter.

is now rapidly becoming the accepted ally of the everyday provider of news pictures. The recent Royal Wedding is a case in point. The dull and foggy atmospheric conditions that obtained on the morning of the pageant, and the adverse lighting of the interior of the Abbey, would have rendered the production of adequate action pictures taken in a fraction of a second an almost hopeless proposition, if not impossible, a few years ago. Yet on this occasion, with the help of the magnificent plates, films and large-aperture lenses now available, not only were high-speed shots of perfect quality obtained of all phases of the procession and the ceremony, but they were presented to the public within an hour or so in the afternoon papers in the form of pages of perfect reproductions. While much credit is due to the skill, enterprise and activity of the Press photographers responsible, and much to the remarkable organisation of the various departments of the newspapers concerned, we feel that the greatest praise should go to those who have made the photography and the ciné pictures of such events possible at all. It is a matter that is apt to be overlooked by the general reader, who takes the marvels of to-day for granted.

Pity the Projectionist.

Every audience turns its back to the lanternist and generally dismisses him from its thoughts. In the same way, the film projectionist behind his portholes is very little regarded, but he has his point of view, as Mr. S. T. Perry, of the Guild of British Cinema Projectionists and Technicians, told an audience at the Cinematography Exhibition in Russell Square last

week. The change-over to the talking film has not been without its tribulations for the projectionist. The projection equipment in the average cinema usually consists of two projectors equipped with sound apparatus, together with, in many instances, an ordinary lantern for slides, and where an organ and stage show are used, one or two "spot" lights. Cleanliness is of first importance, dust being the mortal enemy, not only of the film and projector, but of the sound equipment also. Film mutilation, which is the cause of stops during projection, and of scratches in the picture and defective sound transmission, is due, above all things, to oil and dirt and dust being allowed to get on to the film. Print density is another ticklish subject.

What is badly required is a standard printing density and also a standard illumination. Some pictures are over-illuminated, killing all the high-lights; others do not get enough light on the screen. In every case, in order to provide the best possible results on the screen when the film is running, the projectionist has to deal with the matter.

Hazardous Adventure.

The world, as we have often said, does not know all its heroes, and some of them carry, not a sword, nor a pick-axe, but a camera. When the editor of the Pathé Pictorial was talking the other evening about the "interest" film we thought at first it was a purple passage in which he described how, in order to get pictures for the public, men would

cleave the skies and descend into the bowels of the earth, would brave the hot desert and the cold Arctic, and would stand in the path of motor-cyclists in a speed contest or prowling beasts in a jungle. But he went on to tell of one photographer—who had never been down a coal mine before—who went down a Yorkshire mine the other day to photograph a blasting operation. The fuse was laid, and the miners at the signal retreated, but the photographer remained, like the boy on the burning deck, standing by his camera while it got a record of the explosion at twenty feet. And because a lump of coal hit his camera, so that he feared it had upset his picture, he waited for the next blasting, and did it again. That's the stuff!

"The Amateur Photographer" EXPOSURE TABLE—December

EVERY MONTH a brief exposure table will be provided for the assistance of our readers in their practical work. A glance at the current approximate exposures as here given will serve as a reliable guide for most purposes. The subjects will be varied to suit the time of year. The following exposures will serve as a working guide for any fine day during the month, between the hours of 10 in the morning and 2 in the afternoon, with the sun shining, but not necessarily on the subject. Stop used, f/8. The exposure should be doubled if the sun is obscured, or if stop f/11 is used. For f/16 give four times the exposure. For f/5.6 give half. From 8 to 10 a.m., or from 2 to 4 p.m. double these exposures. From 7 to 8 a.m. or from 4 to 5 p.m., treble them.

| SUBJECT. | Ordinary. | Medium. | Rapid. | Extra Rapid. | Ultra Rapid. |
|---|-----------|-----------|-----------|--------------|--------------|
| Open seascapes and cloud studies | 1/20 sec. | 1/30 sec. | 1/60 sec. | 1/80 sec. | 1/100 sec. |
| Open landscapes with no very heavy shadows in foreground, shipping studies or seascapes with rocks, beach scenes .. | 1/10 " | 1/15 " | 1/30 " | 1/40 " | 1/50 " |
| Ordinary landscapes with not too much foliage, open river scenery, figure studies in the open, light buildings, wet street scenes | 1/4 " | 1/6 " | 1/12 " | 1/15 " | 1/20 " |
| Landscapes in fog or mist, or with strong foreground, well-lighted street scenes .. | 1/3 " | 1/4 " | 1/10 " | 1/12 " | 1/15 " |
| Buildings or trees occupying greater portion of pictures, river scenes with heavy foliage | 3/4 " | 1/2 " | 1/4 " | 1/5 " | 1/6 " |
| Portraits or groups taken out of doors, not too much shut in by buildings | 2 secs. | 1½ " | 1 " | 1/2 " | 1/3 " |
| Portraits in well-lighted room, light surroundings, big window, white reflector. .. | 6 " | 5 secs. | 3 secs. | 2 secs. | 1½ " |

As a further guide we append a list of some of the best known makes of plates and films on the market. They have been divided into groups which approximately indicate the speeds referred to above. The hyper-sensitive panchromatic plates and films require less exposure than the ultra-rapid

The Visiting Lantern-Lecturer

In the following seasonable article the subject of the lantern lecture is dealt with from another angle. While it will appeal to every lecturer who visits a photographic society, it is intended more for the guidance of the Hon. Secretary or others responsible for the lecturer's visit.

ABOUT this time of year it is usual for articles to appear, giving advice to actual or would-be authors of lantern lectures on what to aim at or avoid.

It seems reasonable that a few hints and suggestions should also be given to secretaries of clubs and others who organise such entertainments, as to what best makes for the lecturer's enjoyment and comfort.

At first it may appear a little ungracious to attempt to do so, since the intention in all cases is so obviously hospitable and kindly; but since, in spite of this, the results experienced are so varied, those in control must often err merely through ignorance of the ideals to aim at.

The First Step.

A reminder of the fixture is, of course, essential, and if the lecturer is paying his first visit full directions as to how to reach the lecture room should be sent him; in addition, where the room is not easy to find, things will be much simplified for him if someone is told off to meet him at the station. Prolonged groping through badly-lit streets—possibly on a wet night—is not a pleasant prelude to the evening.

Something to Avoid.

Except in cases where it is absolutely unavoidable, an ordinary general meeting of the club should not be held before the lecture begins. It is unsatisfactory for the lecturer, who has perhaps made an effort to arrive in time, to find that he is expected to wait after the advertised hour, not only until a sufficient audience has drifted in, but beyond that through the transaction of uninteresting routine business. Meanwhile he becomes more and more conscious that his prospect of reaching home in any reasonable time is becoming momentarily more remote. Meetings should, of course,

start to time—some do; but to urge this as general practice is perhaps to expect too much from human nature.

Securing Comfort.

The most important points of all are those which minister to the lecturer's comfort during the actual delivery of the lecture. It may seem obvious that he should be so placed that he has a secure foothold and can reach the screen when necessary. Yet it is often the case that he can with difficulty move without entangling himself in the flex of his reading-lamp, or stepping off the edge of the platform. In one case we recall, the lecturer was placed on a high platform and the screen on another—the pointer provided being too short to reach across the gulf. After one attempt at crossing this without disaster in the dark, he was compelled to resign himself to pointing vaguely at the screen from a distance.

As far as loose flex is concerned, a little thought only is generally required for this to be led safely to the reading-lamp on the side away from the screen, although due allowance must be made for the cramped space available in many lecture rooms.

Lamp and Signal.

While he may not wish to read his lecture—and many will maintain that no lecture should be read in its entirety—the lecturer may reasonably expect to make use of a few notes, so that not only a lamp, but a proper reading-desk will be required. Should he be tall, and the lamp be placed, as it often is, on an ordinary table, he is in the unfortunate position of having repeatedly to stoop and peer at his notes; a most disastrous thing from the point of view of continuity. The ideal desk should be adjustable for height.

Again, unless it is quite impossible,

some form of electric signal to the lanternist should be provided. The clicks and bangs otherwise required are, at the least, distracting. But while the lanternist should always be alert for the signal, and prepared to change slides promptly, to be too early in doing so is often as bad as being too late. In one case the mere movement of the lecturer's hand towards an electric push produced a change of slide, and since he happened to be relying upon the appearance of each slide at the critical moment in his sentence, the intended effects were largely spoilt, in addition to half his attention being diverted towards defeating his over-zealous assistant.

Generally speaking, he should be left free to think of nothing but his slides and of what he intends to say about them. The distraction of his attention in any other direction is bound to spoil the lecture, more particularly if his experience is not very great.

Subsequent Proceedings.

After the lecture itself is over there are various ways of closing the proceedings, of which probably the best is for the chairman to invite questions, and when these have been answered, to propose a vote of thanks himself. It is not always easy for a lecturer who does not see his audience to be sure of the effect he is producing; but a series of questions will leave him assured that he has interested them.

Similarly, a habit prevalent in some clubs of applauding any slides which are considered particularly good, will prove a great encouragement during the course of the lecture. In the case of one of a popular type the response to points upon which he counts to raise a laugh will give the lecturer some indication; but with one of the

more serious kind it is only by the silence and absence of coughing and feet-shuffling that he will get an idea if he is completely holding his audience's attention.

The practice frequently followed of calling upon a particular member to propose a formal vote of thanks is seldom really successful. If he is not used to speaking, his thanks may not carry conviction, while—far worse—if he is, he may quite likely deliver a miniature lecture himself, which is bound to prove an anti-climax for the rest of the audience, unless it be an improvement on the lecture, when it is even more undesirable! In either case,

few speakers like to be lectured on their own subject.

Finally, the hon. secretary or treasurer should always discreetly inquire what the lecturer's out-of-pocket expenses may have been, and if any question of fee has arisen (and every visiting lecturer should be asked as a matter of course if he requires a fee) this should be handed to him at a convenient moment before he leaves, or a cheque sent within a day or two.

While it is no doubt a fact that, unless they enjoy showing and talking about their slides, lecturers would not put themselves to the often considerable inconvenience,

and travel long distances, to do so, yet—as anyone who has been lecturing for some years will probably agree—there are visits to certain clubs and societies which are marked with red in his memory. Places where everything seemed to go smoothly and with the minimum of effort; where his slides were perfectly handled—and showed no finger marks; where they were really adequately illuminated; and where he felt that his trouble in coming had been appreciated, and not merely accepted as part of the routine of the ordinary weekly meeting. It may well be the aim of every secretary to make his society one of these.

Smoking in Portraiture

By D. G. WRAITH.

IT is a curious thing that few amateur photographers take their friends in the act of smoking. At no time is a man, if not a woman, more natural than when smoking. Not only are the necessities, the pipe or cigarettes, matches, and tobacco pouch or cigarette-case, interesting things to have along with a portrait of a friend, but the actual expression during smoking is prone to yield results at once charming and characteristic, and out of the ordinary.

There are many types of smoking

pictures. There is the kind where the man or woman is about to light up, and is posing in characteristic attitude. Then there is the picture, which is virtually a snapshot, showing one's friend in the act of waving the match out, after lighting up and drawing that first delightful draw. I have known a friend of mine to have a far more delightful portrait taken in this way than was ever taken at a portrait studio.

The difficulties are not many. It is essential in most cases that the sitter be actually smoking, and the

A good attempt, but would be better for a darker background, and if the man looked at his pipe instead of the camera.

times for exposing will vary, some being taken long after the last puff and just before the next one; some actually during the puff of smoke as it passes the sitter's face, some during conversation with pipe held in hands, and so on. An old man looks splendid with a pipe, even if it is an inverted clay, and to ask him to remove his pipe to have his portrait taken is a ridiculous proceeding.

The background should be chosen to show up the smoke, and the photographer may neglect the light of the match altogether. The negative should be developed a little on the thin side, and panchromatic films or plates give an enhanced result. Great care should be taken when photographing a subject who is lighting up, that the hands do not come too far in front of the face, and become blurred and out of focus.

The first puff.

Landscape or Portrait?

AN INTERESTING WINTER
EVENING EXAMINATION.

By D. S.

HAVING occasion recently to supply a number of illustrations which had to be of portrait shape and a certain type, I was compelled to conduct a careful examination of my reference prints. Before filing, these are

always trimmed to what I consider the best proportions, so that the exact picture may be seen at a glance.

In searching for my special subjects I found a number were of landscape dimensions, but, experimenting with the two L-shaped pieces of card so often recommended in the columns of *The Amateur Photographer*, I was surprised to find how many of these would become "portraits" by simply trimming from each side. I completed my set, and, necessity having shown that my previous decision as to the picture shape from any

given negative was too arbitrary, I settled down to a thorough study of a number of prints.

I then found that I had a number of each shape which would easily trim to the opposite. This was both interesting and useful information which should be recorded, so, for quick reference, I shall in future trim to one shape and mask the second by means of two ruled lines, thus saving time and trouble of making another print.

This case is brought to the attention of readers because it was not just a matter of searching for a small picture within a large print, but a straightforward trim from one or both ends which made a world of difference to the presentation of the finished enlargement. It is such a simple yet interesting experiment that a pleasant and profitable hour could be spent in the depths of an arm-chair examining one's prints. Whatever the result, it should be time well spent, for—particularly with beginners—trimming is an art which receives too little attention. And trimming can make or mar a picture.

THE IKOFLEX MINIATURE "REFLEX"

ANY new camera from the firm of Zeiss Ikon is always interesting, and their latest introduction, the "Ikoflex," has many outstanding qualities that will at once appeal to the miniature camera user, particularly those who prefer the twin-lens type and the $2\frac{1}{4} \times 2\frac{1}{4}$ size picture.

The "Ikoflex" has an all-metal die cast body, leather covered, is extremely strong but very light, and is a remarkably well-made piece of apparatus with many points in its favour for the practical worker. It is of the twin-lens type, which shows the picture in the top viewing screen, brilliantly clear, and the right way up. The hood, which springs into

position, is furnished with a magnifier, so that perfect focussing can be secured. Two anastigmats are used with the "Ikoflex" of precisely the same focal length and aperture. The view-finder screen gives a particularly brilliant image due to the use of a special condenser lens embodied beneath the ground glass. This increases the illumination to the corners of the picture.

All the scales on the "Ikoflex," such as shutter speeds, diaphragm, depth of focus scale, can be read from above—that is, from the position for taking the picture. Focussing is conducted by a single lever movement for both lenses, and an automatic depth of focus scale is fitted which shows the range of focus for any particular spot. The everset shutter is the Zeiss Ikon three-speed Ikoflex, giving $1/25$ th, $1/50$ th and $1/100$ th, as well as "Time" and "Bulb."

To load the camera, the interior is released and comes away from the bottom in one piece and the film is

then loaded in the usual way between the spool clips. After the first number on the film has appeared the remainder of the exposures (twelve can be obtained from an ordinary $2\frac{1}{4} \times 3\frac{1}{4}$ film) are indicated on a counting dial at the side of the camera.

The changing of the film is actuated by a lever. Provision is made for film spools on wooden cores and those on the smaller metal cores. Focusing is done by a movement of the focussing lever which is conveniently placed for the left hand, while the right hand can be used for holding the camera, using the right thumb for the shutter release.

The camera works extremely smoothly both in film-changing, focussing and exposing. It is supplied with Novar f/6.3 anastigmat at £6 10s. or with the Novar f/4.5 at £7 10s.

Further particulars and illustrated booklet concerning the "Ikoflex" are obtainable from Messrs. Zeiss Ikon, Ltd., Mortimer House, 37-41, Mortimer Street, London, W.1.

WINTER in

By R. M. FANSTONE.

A liner being towed into dry dock. 1/50th sec., f/6, 'Chrome Film.

DOCKLAND offers the photographer many and varied opportunities for picture-making at all periods of the year, but especially during the winter season. At this time of year at many docks at various places round the coasts of the British Isles there are more vessels in port than during the summer months, and there are greater possibilities for pictures, in spite of the limited number of hours of daylight available.

It is during the winter months that many ships are given their annual overhaul, some while still afloat, while others go into dry dock, and there is activity on all sides that will provide endless subjects for exposures. There are also those effects of mist and sunshine, often in effective combination, which will prove helpful to the picture-maker.

Those photographers who are attracted by the so-called "modern" movement in photography will find plenty of subjects for experiment along the quaysides. There is abundant scope for pictorial treatment of the commonplace objects of dockland when these are seen from new angles.

Individual ships, as such, will not be so attractive as records for the

photographer as for the varied subject matter they provide. It will be found that in many cases the part is greater than the whole, and some "bit" of a vessel, seen against a good sky, or a mass of mooring ropes in the foreground, will be more effective material for picture-making than the entire ship.

There are also such things as coal barges, bollards and cranes which make for pictures of novel character, especially under unusual lighting conditions.

The morning is usually the best time for dockland pictures, as there is generally more activity between

In dry dock. At work overhauling the propellers of a liner. 1/25th sec., f/3.5, S.S. Pan. Film.

The bow. Painters at work. Misty winter morning. 1/50th sec., f/6, S.S. Pan. Film.

9 a.m. and 12 o'clock than at other times, and at this time of year the light is then at its best.

Dockland is constantly changing, and the same quayside will provide a constant variety of subjects. Ships arrive and depart, and the tugs and barges change their positions, the composition differing each hour, while the lighting and cloud effects are similarly ever new.

In addition to the activities of dockland, there are the quiet days, when the reflections of vessels moored can be caught in the quiet waters of some basin. It is not always the busy days that provide the best pictures, although the arrival or departure of vessels attended by their tugs, the latter

DOCKLAND

generally providing plenty of suggestion of action by the steam and smoke that they emit, will attract many photographers.

For most of these subjects almost any type of camera can be used, but, after wide experience, I prefer a camera of the ever-ready type, which is inconspicuous and unobtrusive in action, used at eye-level. The camera I use is a "miniature," giving negatives of 4×3 cm. size.

Large lens apertures can be used, ensuring full exposure in the case of those subjects which present masses of shadow, yet which, on account of possible movement, demand an exposure of $1/25$ th of a second or less. There is plenty of depth of focus permitted with a camera of this type, even at $f/3.5$.

A coat of paint. $1/50$ th sec., $f/6$, 'Chrome Film.

As many of the most attractive subjects are seen "against the light," an "all-round" lens-hood is necessary if bright negatives are to be secured. A sky shade is insufficient, as in most cases the water in the foreground reflects as much light as the sky.

The modern high-speed "chrome" or, better still, panchromatic films of the double-coated type are excellent for these subjects. They retain the quality of the water, which may be easily lost through halation. If plates are used they must be backed.

Winter sunshine in the docks. $1/50$ th sec., $f/3.5$, S.S. Pan. Film.

Lastly, it is well to point out that dockland is usually private property, and, if photographs are to be taken, permission should be obtained beforehand from the general manager or the docks superintendent. This will at least save the photographer from obstructions by lesser fry, and permission will be readily granted if the photographer states to the proper authority the nature and purpose of the work to be done.

Moorings. November midday. $1/25$ th sec., $f/3.5$, S.S. Pan. Film.

AN ENLARGING HINT

MANY workers who use both miniature and normal size cameras have to use an enlarger designed principally for comparatively large negatives, and experience difficulty in producing the full-sized enlargements that a good

miniature negative will provide with the apparatus at their command. The size of the ordinary dark-room is not always such that a sufficiently long throw can be obtained, and even if it were, correct focussing when the image is several feet from the operator is no simple matter.

There are two methods of overcoming this difficulty, short of buying a special miniature enlarger. The first is to provide a lens of short focus which can be interchanged with the normal enlarger lens, or alternatively to fit a portrait attachment or supplementary lens to the enlarger lens, thus shortening its focal length. This method, however, has the disadvantage that it may be found impossible, owing to the construction of the enlarger, to centre the lamp at the correct distance from the condenser to secure an even disc of illumination for printing.

The second method need entail no expense, and is simple to arrange. It consists merely of providing a mirror, of good quality, and fixing it securely to reflect back the projected image from the enlarger to the easel which has been placed to receive the reflection.

The sketch illustration should make the arrangement clear, and it will be noted that the enlarger and easel must be arranged at angles to the normal of the mirror that are at least approximately equal to each other.

The negative must, of course, be reversed in the carrier if the print is to appear the right way, and care must be taken that no extraneous light from the enlarger lamphouse is allowed to reach the paper.

This method has the advantage that the operator can be quite near to both the enlarger and the easel while focussing, whatever the length of the throw.

THE "RETINA" MINIATURE CAMERA

The New Kodak for
35-mm. film.

IT appeared inevitable that the Kodak Company would sooner or later enter the field with a miniature camera taking thirty-six exposures on 35-mm. film, and the "Retina" now makes its appearance.

The "Retina" is a remarkable little production in many ways; it frankly caters for those who, in the first place, wish to pay a moderate price only for a camera of this type, and at the same time do not wish to learn a new technique in the handling of the instrument itself.

The "Retina" is founded on the methods of handling that have become familiar throughout the world in the use of the ordinary type of folding Kodak. The back of the camera is opened and the film spool inserted in the way with which millions of photographers are accustomed. The shutter is set independently and the winding is independent of the shutter. In this way, the Kodak user has nothing new to learn, and he has the advantages offered by a soundly made instrument of precision which will take a standard spool for thirty-six pictures 24×36 mm. on a perforated 35-mm. Kodak film. This film is supplied in daylight-loading cassettes in both the well-known Kodak grades of "Panatomic" and Super-Sensitive Panchromatic.

The "Retina" itself when closed is a very pleasing little camera to handle. It is small, comparatively light, and is beautifully finished. It has an all-metal body, leather covered,

and is of the baseboard type which snaps open, bringing the lens, shutter and camera front into position. When closed these vital parts of the instrument are protected by the closed baseboard.

The lens fitted to the "Retina" is a Schneider Xenar $f/3.5$ anastigmat, with good covering power and great depth of focus, coupled with the finest definition. The small negatives made with this lens at full

aperture when sharply focussed are capable of considerable enlargement without loss of image detail.

The lens is fitted in the well-known Compur shutter with speeds up to $1/3000$ of a second which, coupled with the large aperture of the lens, is sufficient for the fastest moving objects that the amateur is likely to attempt. The shutter gives intermediate speeds down to one second, and also "T." and "B."

The focussing is admirably controlled by the movement of a pointer on a large outer ring holding the shutter,

and the shutter release is very conveniently placed for both upright and horizontal pictures. A sensible feature is that the scales are repeated on the barrel of the shutter, so that they may be read whether the camera is held vertically or horizontally. In conjunction with the focussing arrangement is an independent depth of focus scale which tells at a glance exactly how much in front and behind the object is in focus.

The view-finder is particularly worthy of note as being an enclosed direct-vision box-type, very small and neat, giving a definite magnification and a clear-cut image.

In use, the film is very simply loaded into the camera similarly to an ordinary daylight-loading Kodak. It is then wound forward for each exposure and is checked when sufficient of the film has been changed. The exposures are automatically indicated on a counter.

After the entire film has been exposed, the winding mechanism is reversed and the film is wound back into the original cassette, which can then be removed in daylight from the camera for development. In this respect it is simplicity itself.

It is a delightful little camera to use, and not the least of its attractions is its price, which is ten guineas only, and at this figure is likely to have a very extensive sale among amateurs who are interested in modern miniature camera work.

Letters to the Editor

The Editor is not responsible for the opinions of his correspondents.

A PHOTOGRAPHIC CALENDAR.

SIR,—I should like to draw your attention to the paragraph appearing in "Topics of the Week" of 21st November, regarding "A Photographic Calendar" published in Germany.

As this paragraph may lead the British (photographic) public to believe Germany leads in such publications, might I point out that, while such may apply to England, it does *not* apply to Scotland.

Surely you have overlooked the magnificent picture calendar which has been published for a number of years by the proprietors of *The Scotsman*, Edinburgh. This calendar contains fifty-two pictorial photographs—each 8×11 in.—of the best views, etc., in Scotland. The 1935 Calendar is on sale everywhere in Scotland, and the publication may, as usual, be sold out soon.

I have also seen other photographic calendars published in Scotland, but not of the same quality.

I may say I have no connection with *The Scotsman*.—Yours, etc.,
"SCOTLAND AYE LEADS."

ANASTIGMAT LENS.

SIR,—In his comments upon anastigmat lens, Mr. K. M. Bevins has unfortunately chosen the wrong explanation.

When we focus our lens it is usual to rack the lens nearer to the plate as the object focussed gets farther away. Therefore to comment that the image of the farthest point of the wall falls on to that part of the plate farthest from the lens is rather misleading. It is only natural to suppose that this point will be very much out of focus.

As a matter of fact the screen plane (i.e., the plane at which the image is sharply focussed) is, in an ordinary lens, actually a curve. This is corrected in a modern anastigmat by the opposing curvatures of the components of the lens, and also by judicious use of finest optical glass, having suitable refractive indices.

Such problems and the methods used to solve them make the modern anastigmat lens a marvel of human ingenuity.—Yours, etc.,
H. S. BURDETT.

MINIATURE PLATES AND PACKS.

SIR,—Miniature workers do not all use roll film. Is the small plate ($4\frac{1}{2} \times 6$ cm.) user at a disadvantage regarding emulsion range on small plates and flat films? In spite of the marvellous progress in the different emulsions on plates, one important coating is missing. I refer to the wonderful grainless Panatomic or ciné film pan. emulsion. Using $4\frac{1}{2} \times 6$ cm. flat films and plates or film packs, it seems to me the most valuable emulsion is not available. Can we V.P. plate-users have a flat film or pack with Panatomic emulsion? Or is there some difficulty about this?

Enlarging from miniatures the utmost definition is essential. Do we all realise the difference in results between working with full aperture on the enlarger and stopping down to quite a small stop? I have not heard this stressed, and would like to hear general opinion.—Yours, etc.,
W. H. CLARKSON.

D. & P.

SIR,—May I utilise your columns once again, in order to ask Mr. H. Simons to re-read my letter of the 14th November. My "bone of contention" is directed especially against the small D. & P. man.

I ask that any person offering to develop and print films be equipped so as to turn out same free from mechanical defects.

It may be of interest, if not new to Mr. Simons, to learn that even advanced amateurs are sometimes glad to avail themselves of the service offered by D. & P. men. Then it becomes most disappointing to find that such people cannot turn out work of their own standard.

I regret that I have no information concerning "invisible clips" or of determining when the image will appear.

If I should happen to come across either, I shall ask the use of your columns again, in order to pass the tip on.

Through the medium of this paper I have obtained invaluable assistance since starting photography. I should always be delighted to pass on—through the same medium—anything of use to my fellow-workers.—Yours, etc.,
W. H. LEWIS.

MINIATURE CAMERAS.

SIR,—Mr. Burr is indeed unfortunate in his choice of miniature cameras. I have been using a Rolleicord, taking negatives $2\frac{1}{2}$ in. square, for some time, and find no difficulty in obtaining perfect enlargements up to whole-plate and bigger; in fact the enlargements in the bigger sizes are sharper and of better quality than those I have previously obtained from glass quarter-plate negatives, using a large swinging-mirror reflex. Recently I exposed a spool on three or four budgerigars, from inside their cage, and enlarged some of the resulting negatives about five times linear (equivalent to prints nearly a foot square). The enlargements were perfectly sharp, and could not easily be distinguished from contact prints, the detail shown in the eyes being remarkable. All the negatives were taken at full aperture (f/4.5), with normal film and after-treatment. As with all miniature cameras, it is essential to keep the instrument rock-steady during exposure, and I find it a distinct advantage to use a long cable release and, if possible, a tripod.—Yours, etc.,
A. T. WALKER, M.Sc.

DEVELOPING TANKS.

SIR,—I have read Mr. Stirling's letter and that of Mr. Bayley, in your issue of 21st November, with much interest, as I have had similar trouble through the backing-paper of certain panchromatic films sticking to the film itself after development. Eventually I wrote the makers of the film I was using, and they confirmed my impression that it was due to the adhesive nature of the back coating on the celluloid film.

I do not think that Mr. Bayley's explanation would overcome the trouble so far as these particular films are concerned, as the backing-paper itself naturally gets soaked with developer and so adheres most tenaciously to the film.

Two months ago I was introduced to the new Agfa roll-film developing tank, which separates the backing-paper from the film before insertion in the developer. So far I have developed about eighteen spools in this tank—all without trouble, save one which was my own fault through not pulling the backing-paper out exactly as instructed. The Agfa tank is in every way ideal for Agfa pan. films, which are on a fairly substantial celluloid base; but I have been told that these tanks, which depend on grooves only to support the film, are not so suitable for films the celluloid of which has a "flimsy" body.

On page 445 of your issue of 14th November you review the "Optichrom Automat," which apparently performs somewhat similarly to the Agfa tank, but of the Optichrom I have no experience. If Mr. Stirling is a user of Agfa films, he cannot do better than use an Agfa tank, and his troubles will quite disappear.

I write from quite a disinterested point of view so far as Agfa are concerned.—Yours, etc.,
LESLIE WALLACE.

SIR,—After winding the film and apron into the holder of a Kodak tank, and securing with rubber band, I immerse the whole in a jug of water—raising and lowering the while—for a full minute. After removal, the surplus water is let run out, and development proceeds as usual. This method gives ideal results.

Once a panchromatic film did stick to the backing paper. I placed film and paper, excepting the two ends, in a large acid fixing bath. The film fixed, the paper came off; the blue backing completely disappeared!

Some Continental films have no adhesive tag at the lower end. I therefore pin the latter to the paper, preferably in the dark-room. This works admirably.—Yours, etc.,
A. TROWBRIDGE.

With the Beginners

Every week an article will appear under this heading dealing with a topic of interest to the novice in photography.

NOTES & NOTIONS
for the
LESS ADVANCED
WORKER

POINTS ABOUT DEVELOPMENT.

LAST week I considered a negative of a black-and-white drawing, showing how this negative would have to produce in the print white paper for the high-lights, black silver for the darkest touches, and the whole series of intermediate greys. I represented these tones by numerals from 0 to 10. Now I suggest them by diagrams. Both methods are merely symbolical, and do not, of course, represent the complicated disposition of the tones by which the final picture is reproduced.

In the diagram, Fig. I represents the under-developed negative. There is considerable unaltered emulsion, and only a short range of densities, the deepest of which does

not go through the emulsion as it should. Fig. II represents the complete range, from clear gelatine to a deposit that goes right through the emulsion, representing a density that will completely withstand the printing light, and give white paper in the print.

Fig. III represents what happens if development is carried too far. There is full density not only for the highest lights, but for the lighter tones as well. These delicate tones will therefore be lost in the print, and there will be white paper where there should be a varied range of light greys. Such a print is "chalky" and unsatisfactory.

Now for a few words about the time and temperature method to which I referred last week. The facts I am going to use to illustrate the points are quoted from the latest edition of the Burroughs Wellcome Diary. The seven development times given in each case are for temperatures of 45, 50, 55, 60, 65, 70 and 75 degrees Fahrenheit, respectively, and in each case the time quoted is in minutes.

Tabloid Rytol, normal: $8\frac{1}{2}$, 7, 6, 5, $4\frac{1}{2}$, $3\frac{1}{2}$, 3.

Tabloid Rytol, one-third normal strength: 34, 28, 24, 20, 17, 14, $11\frac{1}{2}$.

These figures at once show two things: first, that temperature has a marked effect on development time; and, secondly, that mere dilution of a developer also makes a great difference.

Tabloid Tancol, normal: 17, 14, 12, 10, 9, 7.

Now we can see that much depends on the character and composition of the developer, apart from mere dilution. This is shown further by the figures for the other developers following.

Tabloid M.Q., normal: $5\frac{1}{2}$, $4\frac{1}{2}$, $3\frac{3}{4}$, 3, $2\frac{1}{2}$, 2, $1\frac{3}{4}$.

Tabloid Pyro-Metol: 3, $2\frac{1}{2}$, 2, $1\frac{1}{2}$, $1\frac{1}{4}$, 1, $\frac{3}{4}$.

Tabloid Hydroquinone: 11, $8\frac{1}{2}$, 7, $5\frac{1}{2}$, $4\frac{1}{2}$, $3\frac{1}{2}$, 3.

Tabloid Metol: $10\frac{3}{4}$, 9, $7\frac{3}{4}$, $6\frac{1}{2}$, $5\frac{1}{2}$, $4\frac{1}{2}$, $3\frac{3}{4}$.

There is surely sufficient variation in times here, as the result of different kinds of developing solutions, and of

the temperature at which the operation is carried out. But this is not all. These times apply only to certain plates and films, which are named. All other plates and films are divided into four different classes, necessitating the following modifications of the development times:

- Increase the time by one-half.
- Double the time.
- Decrease the time by one-third.
- Halve the time.

So that we see that another important point to be taken into account is the character of the emulsion.

Still this is not all. The times given above are for the production of thin, delicate negatives, suitable for contact printing on normal gaslight paper, or for enlarging by weak artificial light. If negatives are required for bromide or chloro-bromide printing, or for enlarging by daylight or strong artificial light, the development times should be increased by one-half to give greater contrast. So that another factor to be considered is the purpose for which the negative is required.

And we have not finished yet. The original times given are for the production of negatives of normal contrast, with a certain range of tones from high-lights to shadows. If the subject is dull and flat, and it is desirable to strengthen and brighten the result, the development time may be increased by one-quarter. If, on the other hand, the subject has strong contrasts of light and shade, and these are not to be over-emphasised, the time should be decreased by one-quarter.

We must also remember that the result in any and every case is affected by the exposure given; and, finally, that the development times given are worked out to produce the kind of negatives which Messrs. Burroughs Wellcome consider suitable for their various purposes. It follows that they may not suit the methods and ideas of others, and this will involve a further modification of the time—increasing it to secure greater strength and contrast; or decreasing it for greater softness and delicacy.

All this is surely sufficient to demonstrate the absurdity of the question I quoted last week: "How long should a negative be left in the developer?" This is not an imaginary question, either. A more sensible question is: "What are the development times for a pyro-soda developer?" This can certainly be answered, but only at considerable length. The answer depends on various other questions: What is the composition of the developer, and, particularly, how much bromide does it contain? What plate or film do you propose to use? What is the character of the various subjects? For what purpose do you require the negatives?

When all the factors are duly considered, the best average results are obtained even when plates are developed in one batch in a tank, or a spool of film as a whole. But it is evident that in many cases it is an advantage to give differential treatment, and this is only possible when negatives can be handled singly.

W. L. F. W.

The Novice in the Enlarging Room

THE novice who succeeds in getting bright contact prints from his negatives sometimes gets flat and disappointing results when he tackles enlargements.

Prints are frequently over-exposed, and subsequently under-developed, owing to the use of a too-high-powered lamp. Sixty watts is sufficient to give good results with a rapid bromide paper. A very short exposure gives no time for local shading, and produces harsh tones.

When making test strips, choose carefully an important portion of the negative, containing the extremes of light and shade, and expose two strips in succession over the same portion of the negative, giving one strip rather more and the other rather less than the estimated exposure. These two strips should then be developed together for the same time, and examined in full light after fixing.

It then becomes apparent, not only what is the correct exposure, but also whether shading will be necessary

to obtain detail in the high-lights.

When developing, give a full minute longer than the time recommended by the makers of the paper in use.

If the negative is on the dense side, focussing with a horizontal enlarger can be very trying to the eyes. It is a good plan to keep a stock negative, very thin and dead sharp, to focus on. The dense negative can be substituted when focussing is complete.

Another cause of eyestrain is having to watch the clock and the paper more or less simultaneously. A metronome, set to beat sixty times to the minute, is easy to count, and removes a very real source of fatigue.

When enlarging from an under-exposed negative a much brighter print can be obtained by using a smaller stop and increasing the exposure. Use double-strength developer to which a few drops of potassium bromide have been added.

To avoid ugly stains on the backs of your prints, wash both sides carefully between developing and fixing.

This is especially necessary when using double-weight paper.

Having found a brand of printing paper you like, stick to it.

You can then develop all your negatives to suit the paper, the necessary time of development for the negative being found by experiment. This is a great time and labour saver, besides obviating the necessity of stocking innumerable grades of paper.

If you glaze your prints and wish to avoid a pitted appearance, don't let dust or french chalk fly about the room wherein they are.

The only sure cure for stained fingers is never to dip them in the developer. If you find this a counsel of perfection, apply nail varnish before beginning. Afterwards, apply more varnish, and immediately wash in warm water. All the varnish will be removed and the stain with it.

Finally, get everything you can, except pinholes, into your negatives. After-work is interesting, but lengthy.

W. D.

Don't Overlook the Trade Papers

DAY after day I hear of free-lance photographers who complain that they cannot find markets for their wares. Almost at the same moment editors sigh heavily and regret that they cannot get the photographs they require.

This seemingly contradictory statement is explained by the fact that the free-lance photographer always sends his pictures to the popular Press and always ignores the trade papers.

Editors of trade papers are always wanting photographs of three types—portraits of men in the news, pictures of interesting and attractive window displays, and pictures of newly-opened shops.

If you can produce pictures falling into these three categories you should get in touch with the local correspondents of the papers to which you wish to contribute. It is more satisfactory to work in co-operation with

A NOTE FOR THE FREE-LANCE AMATEUR PRESS PHOTOGRAPHER

the local correspondent, who will usually welcome the suggestion.

As I am forced to take my own photographs I know that the photographs required are easy to take. I am a journalist, not a photographer, yet using a cheap camera I can get photographs which reproduce well.

For the man who knows his job, there is good money to be made in free-lance trade paper photography.

J. F. B.

The above photograph was taken at Wallace Heaton, Ltd., City Sale and Exchange, Master Photo Finishers' Annual Staff Dance and Social, held at the Portman Rooms, Saturday, Nov. 24th. Over 400 were present, and an exhibition of pictorial work by members of the staffs of the various branches was on view. Prizes were given by Messrs. Agfa, Ensign, Ilford, Kodak and R. F. Hunter. The Editor of "The Amateur Photographer" judged the prints and made the awards.

How I make my EXHIBITION PICTURES

No.
CCLVIII.

Mrs. B.
RODNEY
BRYANT.

Methods and Ideals of well-known Pictorial Workers.

From information communicated to our Special Representative.

"PICTURES of exhibition standard are, at any rate in my own case, previously visualised, though unexpected opportunities do occur which provide material for pictorial studies. The vogue for soft focus, with foreground much out of focus, appears to me unnatural; and if such views were seen by the eye as they appear in the finished print, most of us would immediately hasten to the optician.

"The high state of perfection reached to-day by camera manufacturers, together with the various devices for timing exposures and developing negatives to a time-table, would appear to create a tendency to become mechanical; but the experienced operator finds it unnecessary to resort to (shall I say?) automatic devices.

"While a first-rate outfit is very helpful in obtaining excellent results, it is only the experienced hand that can make full use of the possibilities it affords; and though I have a large range of cameras of all descriptions, many of my successes have been gained with apparatus that could not be described as expensive. As an example of this I may mention my recent success in the Champion Class of *The Amateur Photographer Slide Competition*. The study of a tiger, 'Bella,' was made with an old quarter-plate 'Klito' camera, aperture f/11, on an Imperial Press plate, speed 850 H. & D., with the aid of a Sashalite bulb held nine feet from the subject.

"There is no doubt that we all have our favourite subjects, and I find natural history subjects are particu-

larly fascinating. Others to whom they also appeal will find the management and staff of such institutions as the Belle Vue Gardens, Manchester, and the North of England Zoological Society, Chester, ever ready to afford every facility. Studies of animal life are to be found at all the leading exhibitions, but the enthusiast is always out to do something better, and a really good picture will not fail to attract some attention from the judges.

"Hunting scenes in a lane, from a picturesque point of view, have always had an appeal for me, but if you are favoured with sunshine there is the difficulty of heavy shadows to overcome. I have also photographed gulls in flight, which, by reason of the constant change in formations, present ever-changing pictures. Fox cubs at play and salmon leaping have also given much that is interesting, but they cannot be recommended as subjects for exhibition, as it is not difficulties that appeal to the judges so much as balance, tone and lighting.

"Snow scenes always make very attractive prints, as the brightness makes up for the lack of colour, which seems so essential when one visualises the country bathed in those wonderful autumn tints which cannot be reproduced in a print.

"While I only commenced entering for exhibitions four years ago, I have been an enthusiast for a considerable time. I must confess to a preference for plates. Iso-Zenith or Imperial S.S., according to the subject in hand, are my usual selection; and dish development, usually with pyro-soda. The judicious use of the air-brush, with a little retouching and spotting, help to make the finished print approach the heights of perfection; and the experience gained in oil and water-colour work is of great assistance in adding these finishing touches."

PICTURES of the WEEK

Some Critical Comments on the Beginners' prints reproduced on the opposite page.

NO. 1 of the prints on the opposite page—"The Worker," by J. Miller—is quite an excellent piece of characterisation, but it is rather a pity that the work upon which the figure is engaged does not permit his face, or the major portion of it, to be seen.

Subjects at Work.

The fact that he is at work, of course, does provide a sort of justification for the omission, but, nevertheless, there is a suggestion of something missing that would have been avoided had it been found possible for the features to have been shown.

They so naturally are looked for as the focal point of interest that their lack is felt, and the representation loses point. On the other hand, it is recognised that any attempt to make the figure alter his pose would probably be fatal. Camera consciousness and a consequent loss of spontaneity would intervene, and, in nine cases out of ten, the attempt at remedying the defect would be worse than the disease.

The idea is to get the features without loss of spontaneity, and, having regard to the position imposed by the nature of the work, it will become pretty clear that it is practically impossible from a viewpoint so directly frontal. The only thing to do, therefore, is to adopt such a standpoint as will give either a profile or a three-quarter view, and if, at the same time, the camera were lowered, the chances are that the rendering would be appreciably improved.

On the whole, and as far as can be judged from the present arrangement, it would be better for a direction to the left of that now assumed to be employed, for not only would the figure seem to fall into a happier pose, but the baskets, as accessories, would appear in a receding, and much improved form.

Looking Upwards.

In dealing with figures, it is often useful to adopt a viewpoint that is lower than normal. In most cases it seems to add to the height, with, perhaps, a gain in impressiveness, and, in the case under review, other

advantages accrue as well. In No. 4, "The Cottage Staircase," by John Giddings, it adds height and dignity to the little figure, and a consequent gain in impressiveness is conferred. Here, again, it would have been better if it had been arranged for part of the profile to be shown, but to do so would have involved the co-operation of the sitter.

The probability, although there is nothing to say so, is that the figure was posed, and, in that event, it would have been wiser for the child's attention to be directed to something outside in the opposite direction to that in which she is now looking.

Nevertheless, as the print now stands, it strikes one as very well managed, though a little more vigour in the presentment would not be out of place. No. 3, "My Lady Leisure," by Edward Jenkins, affords a further example of the choice of a viewpoint that is looking upwards. The added qualities of height and dignity are again in evidence, and the print itself displays a vigour that is particularly welcome after the somewhat exaggerated softness of No. 4. Possibly, printing might be carried a stage or so farther without losing the shadow gradation, and the consequent improvement in the rendering of the lighter tones would make the trouble well worth while.

Exaggerated Viewpoints.

The same expedient might be applied, again, to No. 2, "A Worm's Eye View," by W. A. Player Shute, where the lighter portions are almost devoid of tone. The upward viewpoint, here, has been carried to excess, and, having regard to the comparatively short focus of the lens, has resulted in an apparent distortion in the perspective that is decidedly not flattering to the sitter.

In the other cases that have been mentioned, there has been a reason and a justification for the adoption of a lower than the usual viewpoint. The end has justified the means, but, in this instance, the effect is so exaggerated that its object, if anything but an expression of eccentricity, has been defeated. It cannot be said to have any especial purpose, nor, except as

a freak, has it any claim upon the attention.

In comparison, No. 5, "Sea Breezes," by B. S. B. Tucker, strikes a more pleasing note, and, here, the justification for the low viewpoint level is to be found in the fact that it has enabled the head of the figure to be shown against the setting of the sky.

Figure and Setting.

Had the head come against the sand dunes, it would scarcely have been so well displayed. As it is, and also having regard to its excellent placing, it claims its due measure of attention as the centre of interest. In point of fact, the way in which the head stands out invites the expression of an opinion that, in all probability, a finer picture would have resulted if the figure had been posed on the top of the hillock in the rear, so that the whole of her figure came against the sky instead of the head alone.

However, the suggestion affords a line for experiment in the future, and will doubtless prove fruitful. Meanwhile, it might be as well to try and get a little more quality in the print, which, at present, seems inclined to flatness.

When heads alone, as distinct from figures, are dealt with, the lower viewpoint is seldom advisable, unless, for example, it is desired to emphasise the chin and lower portion of the face. It is better, as a general rule, to arrange for the camera to be on the same level as the sitter's eyes, and this appears to have been appreciated when Nos. 6 and 7—"Portrait of a Child," by J. W. Walters, and "An Old Jew," by S. J. Vella—were taken.

Outdoor Portraits.

Both are good examples of portraiture out of doors, and in both the lighting and arrangement have been capably handled. The heads, perhaps, are on a rather large scale, and, in consequence, there is just a slight suggestion of exaggeration in those features which are nearest the camera. Much of this could be avoided if the figure were not permitted to come nearer than twelve feet, and, in future efforts, this limit should be kept well in mind. "MENTOR."

Pictorial Analysis

Every week one of the pictures reproduced on an art page will be analysed in detail for the benefit of readers of the paper who are seeking to improve their pictorial work.

"THUNDERSTORM," by B. Moiser.

THE effect of storm—and the promise of sunshine to come—are powerfully conveyed in this picture, yet it is notable that the success it achieves in the transmission of these effects has been attained by a conventional arrangement of the composition, and no recourse has been made to those tricks of placing and viewpoint that are so prevalent in the modern school.

Tradition and Arrangement.

Everything which goes to make up the arrangement has been handled in accordance with the traditional rules of composition. In the first place, and in view of the fact that the main interest lies in the sky, the latter has been allotted the major proportion of the picture space.

It occupies about five-sixths of the total area, and the remaining sixth is devoted to the landscape. For a subject of this class, the relative amounts are calculated in accordance with the traditions imposed by centuries of landscape printing, and the reason is self-evident in view of the comparative attractions of the two sections. For similar reasons, the landscape is not allowed to sink into insignificance, but attains just a sufficient interest to maintain its due function in the picture and to provide a set-off and adequate balance for the immensity of sky above.

Its tones are varied as much as may be, but, on the whole, are on the dark side. That is necessary on account of the great weight of tone at the top of the picture, for, otherwise, a sufficient degree of stability would not be ensured. As it is, the tone at the base is barely enough, and, without questioning the truth of the presentment, it is doubtful if a somewhat less assertive degree of tone in the upper

portion would not provide a better æsthetic impression.

Over-Assertion.

The rendering may be strictly accurate, but, artistically, a lesser depth of tone would be more pleasing and would not display the present suggestion of over-assertion.

At the same time, it must be admitted that the feeling of luminosity—

principal item of interest, and supplies the foundation of the composition.

It forms the keynote, and, as will be seen, occurs close to one of an intersection of divisions of thirds, i.e., it is sufficiently off the centre to avoid any suggestion of undue formality and far enough from the edge to obviate any feeling of weakness. Its strength is emphasised, on the right, by the two trees (2), and, on the left, by the small group (3). These form balancing accents, and not only set each other off, but, by an implied comparison, enhance the scale in which the tree (1) is shown.

The shadows of the clouds in the atmosphere, which happen to fall in radial formation, lower the tone of the sky towards the margins. Their function is twofold. They both help to retain the interest within the picture and prevent the line of the horizon from becoming too assertive—a thing which might easily have happened had the line been as strongly marked throughout as it is just behind the tree.

A Dramatic Effect.

In that position, the contrast is justified because it stresses the suggestion of light, but, if the line were continued in the same degree of contrast it would seem much too hard and persistent, whereas, under the present arrangement, that suggestion is entirely avoided.

The effect is highly dramatic, and the implication of the title is exceedingly well sustained. It is a fine piece of work, and except for the over-assertion above referred to, exceptionally well managed. It is just possible, however, that a slightly greater degree of concentration might be secured by the expedient of using a narrow black margin, suitably softened and shaded off, all round the edges. "MENTOR."

on which the pictorial appeal depends—is appreciably heightened by the contrast of tone between the darks at top and bottom and the light behind the tree. The feeling of light provides the motive, and any alteration that would tend to diminish its effect could not lightly be adopted. Still, the touch of exaggeration exists, and, in order that it may be avoided, some little adjustment might be made.

This, however, should be restricted severely to the top of the print and not permitted to encroach upon the tree (1), which, as the most prominent dark in the scheme, has much to do with the successful transmission of the effect. Moreover, by its placing, depth of tone, and proximity, it provides the

Amateur Cinematography

The Amateur at the Cinema

By M. A. LOVELL-BURGESS.

WHEN the ciné amateur goes to the cinema—and even the loftiest browed amateurs do so at times—he should set himself a series of cinema exercises. It was George Herbert who, in another sphere of thought—that of religion—said that if the sermon was poor God took the text and preached patience. And following the same line of thought I believe that the poorest professional film can teach the ciné amateur something if the amateur will condescend to study it intelligently. But he must *study* it.

The ciné amateur keen on his job watches a professional film with the same intentness with which a musician listens to a musical composition, disentangling, in his mind, the theme, and the recurring *motif* and devices. And one of the first results of such study is a realisation that to achieve emphasis you must have contrast, and that contrast is mainly secured by the use of environment and of speed.

Take, for example, a plot as old as the hills. A rough, simple child of nature, a born leader of men, hears of the murder of his friend, sits quietly bowed in grief until there comes the inevitable reaction—the cry for blood-revenge, and he arises strong in his wrath and sense of outraged justice to summon a desperado army as an instrument of rough justice. You get that situation—as you will know if you read your Bible—when Gideon hears of the death of his two brothers at the hands of the Midianites, and raises three hundred of his retainers in the sacred cause of blood-revenge. You get the same theme in the Wallace Beery picture, “Viva Villa.”

“Viva Villa” is an average film, of the type easy to dismiss as Hollywood melodrama, somewhat reminiscent of the full-blooded Western cowboy days. Yet analyse it, and you will find it full of subtle touches. It is safe to say as much of the average professional film.

How would a competent novelist deal with the theme which I have just outlined? He would aim at contrast between the man's quiet despair and his mood of angry determination; between the little daily happenings that had previously made up the man's life, and the wild exaltation of hatred that proves strong enough to sweep an army into battle. He would get the right *tempo* by means of long paragraphs, deliberately rhythmic, changing to short

sentences and staccato utterances. Even so, the film director has corresponding devices.

In “Viva Villa” we are shown the exiled leader of a peasant army asleep on a tumbled bed. When the news of his friend's death is brought to him he sits with his head buried in his hands, and across his bowed head, seen through the window, an electric sign on the other side of the street flashing in and out, in and out, emphasises the quality of everyday orderliness in the environment. The same effect could have been obtained by a shot of a couple of people gossiping at an open door, or a man crying his wares in the street below. For the rightness of such devices, look back on your own moments of deep emotion and remember how you became suddenly aware of trivial sounds: the rustling of a paper, the closing of a door, the sound of a car changing gear, of a clock ticking away indifferently. Yes, a clock ticking could be used to emphasise grief, especially if its bright pendulum

could be linked up with earlier and happier associations. Do not be afraid to introduce significant touches into your own films. Remember that little touches show a large imagination.

In the film I have selected for analysis the scene suddenly changes. The exiled outlaw leader is keyed up for action, and skilful cutting speeds up the *tempo* of the film. Villa is on his horse. He has summoned his lieutenants. They speed from village to village, summoning Pancho Villa's men. “Villa needs you.” The title is imposed, in very small type, over the picture, over the quick glimpses of Mexican faces, with dark, alert eyes. “Villa needs you.” The words are larger now, white on a dark, moving background of galloping horses, of guns being taken in haste, by toil-worn hands, from under mattresses, from kitchen walls, from old barns. “Villa needs you.” As big now as the last test of the optician. And the peons are coming from every road and field and village at the call of their leader, and the speed of the film

A good topical action subject for the amateur cinematographer can be secured on a turkey farm. There are many to be found in different parts of the country.

and the sound of their song is one with the rhythm of the cutting.

We cannot expect to find players like Wallace Beery in the average amateur ciné society, and perhaps we should not quite know what to do with them if we did, but we can introduce well-thought-out incidents that to a certain extent compensate for indifferent acting. In "Viva Villa," a boy wants to join Villa's army, and on being told that he is too young, he runs and buys a bugle, and after that it is his proud privilege to ride by Villa's side and sound the "Advance." One morning he is shot down. Villa dismounts and holds the dying boy in his arms. And the boy, gathering together his ebbing strength for one last effort, raises the bugle and sounds a last, tremulous "Advance."

Well, of course, if you think that's "sob stuff" you're like a detective who thinks policemen and handcuffs ridiculous. You ought not to be in the business. When Pancho Villa, shot by an assassin, lies dying in the arms of his friend, Johnny, a hard-boiled newspaper man, he asks, with childlike curiosity, what the papers will say of him when he is gone. And the newspaper man, to beguile away the time while the doctor is being called, humours the dying man, bringing into play all his descriptive powers, telling how Villa's last words were, "Forgive me, Mexico," how the peons came crowding quietly round him, a tattered multitude, until, looking up, the newspaper man sees that his bedtime story has become a running commentary on the actual scene, except

that the dying Villa forgets to say, "Forgive me, Mexico," and falters, "Forgive me, Johnny."

Look over the plot of your next film, over that go-ahead, straightforward scenario, think out for yourself a few simple, human touches, and put them in.

Remember, in filming, that shadows can sometimes be more terrible than reality. Try presenting your introductory titles against an animated background appropriate to your film, imposing them on shots of aeroplanes, moving clouds, armies on the march, a Bank Holiday crowd, a sports meeting, a merry-go-round, cartoons, wireless masts, tumbling seas, and so suggest wide horizons.

You are dealing with a medium that knows no margins.

NEGATIVE CARE MEANS POSITIVE SUCCESS

By A. CHAUNCEY.

THE length of a negative's useful life depends largely upon our treatment of it.

This summer I was asked by some amateurs to look through their stock of films and choose some for enlargement. I did so, and of several hundreds found only a few fit to use owing to stains, scratches and pinholes. These were due variously to insufficient fixation or washing, dust, drying or finger-marks.

These are errors easily avoided if a little more care is taken all along the line. The stains, for instance, show that the film was either not fixed properly or else not washed sufficiently. Fixing must be thorough and so must washing, else in a very short while our haste—not to call it

negligence—will find us out (I know, because I was found out long ago!). It is true that after a change or two of water, films look clean, but they are not necessarily so, and it is always best to err on the side of safety.

Negatives have thin skins and do not like much to be handled. When inspecting a wet film it is always best to hold it by the edge, or better still, if possible, by a clip fixed to the edge. Clips may be of the wooden clothes-peg variety, or else of metal. Either of them are obtainable at any "general" shop for two a penny.

Drop-marks on a film look more doleful than tears and are less easily remedied. They will be avoided, however, if the film immediately before being hung up to dry is carefully

wiped on both sides with a soft piece of damp chamois leather that has been well washed and is free from grit.

Neither when wet nor when dry must dust be allowed to come in contact with the surface of a negative, else scratching or pinholes will result. It is an excellent practice to keep films singly in transparent envelopes. They will then be handled without fear of leaving finger-marks, and will be preserved free of dust.

In the dark-room care should be taken that negatives are not handled with wet fingers, or laid down upon a wet table.

These points may all seem very elementary, but they are nevertheless important if we wish our negatives to live usefully to a healthy old age.

NEWS AND REVIEWS

ITEMS OF GENERAL INTEREST FROM ALL QUARTERS.

Ninety-six examples of modern British commercial photography, mostly by the younger men and women, will be included in the Regent Exhibition of 1934, which will be held at Dorland Hall, Lower Regent Street, from December 12th to 22nd. They are entries in a competition for the best photographic presentation of the theme "Happiness"—one that is much favoured by advertisers. Among other attractions Stereoscopic Processes, Ltd. are showing illuminated transparent plates, hand coloured, by which they produce three-dimensional effects.

Pathéscope Ltd., of 5, Lisle Street, Leicester Square, London, W.C.2, announce the introduction of a new projection outfit. This is the "Imp" Model, a machine for the projection by hand of all 30-ft. and 60-ft. reels, and

supplied complete with resistance for all voltages up to 250. Price £4 12s. 6d. The "Imp," which has a perforated lamp-house, is convertible to a motor-driven model for showing 300 ft. of film, and, if bought complete, it costs £7. On the other hand, the Motor and Super Attachment can be bought as separate units at £1 15s. and 17s. 6d. respectively. Further details will be given later, but in the meantime all interested readers should apply to the above address for particulars.

A correspondent has drawn our attention to an error in a recent issue in which a picture was referred to as the "Brig o' Balgowrie." This should be Balgowrie. As well as being a very famous bridge, it is still a first-class bridge for traffic, although built in 1346. It is situated in old Aberdeen.

The Birmingham Photographic Society are celebrating their Jubilee, the Society having been founded in the same year as *The Amateur Photographer*. They are proposing to organise a special exhibition of work with a historical basis and are preparing a volume concerning the Society's history in detail from its commencement.

The Finchley Amateur Ciné Society inform us that the address of their studio is Dollis Mews, Dollis Park, Church End, Finchley, N.3. The Hon. Secretary is Mr. E. E. Thompson, of 266, Hale Lane, Edgware, who will supply all information to ciné workers in the neighbourhood who are interested.

The L.M.S. (London) Photographic Society are holding an exhibition at Euston Station in March next. A class is open to employees of all railway companies in Great Britain. Entry forms and prints are due on February 13th, 1935. Entry forms are obtainable from the Hon. Secretary, Mr. A. J. Scrivener, Station Master's Office, Euston Station, N.W.1.

The Week's Meetings

Societies will have their meetings announced here if the syllabus is sent to us at the beginning of the session or from time to time.

Thursday, December 6th.

Aston P.S. Slide-Making. Bernard Moore.

Exhibitions and Competitions

CURRENT AND FUTURE.

Notices of forthcoming exhibitions and competitions will be included here every week if particulars are sent by the responsible organisers.

The Amateur Photographer Monthly Competitions for Beginners, Intermediate and Advanced Workers. —Entries, December 31. Rules in the issue of November 28.

Chicago International Salon.—Open, December 13–January 20. Entry forms from Salon Committee, Chicago Camera Club, 137, N. Wabash Avenue, Chicago, Ill., U.S.A.

"Northern" Exhibition, City Art Gallery, Manchester.—Open, December 8–January 19. Secretary, J. Chapman, 25, Radstock Road, Stretdford, Manchester.
Western International Salon.—Open, December 10–15. Organising Secretary, W. H. Hill-Muchamore, 24, Church Road, Redfield, Bristol, 5.
8th International Christmas Salon of Photography, Antwerp, 1934–35.—Open, December 23, 1934–January 7, 1935. Particulars from Mr. J. Van Dyck, Secretary of the Fotografische Kring "Iris," Ballaerstr., 69, Antwerp, Belgium.

Madrid International Salon.—Entries, December 10. Particulars from the Secretary, Sociedad Fotografica de Madrid, Calle del Principe, 16, Madrid, Spain.
Preston Scientific Society (Photographic Section). Open Exhibition.—Entry forms due January 11; exhibits, January 17; open, January 28–February 16. Secretary, F. Wells, 65, Powis Road, Ashton, Preston, Lancs.

International Miniature Camera Exhibition, for prints and enlargements made from miniature camera negatives.—February 1–21, 1935. Latest date for entries, January 21. Entry forms and particulars from Exhibition Secretary, British Photographic Fellowship, 7, Aberdeen Mansions, Kenton Street, W.C.1.

South London P.S. Annual Exhibition.—Entries, January 22; open, February 16–March 16. Details and entry forms from Hon. Exhibition Secretary, H. S. Adams, 40, Stockwell Park Road, S.W.9.

Leicester and Leicestershire Photographic Society International Exhibition.—Open, February 25–March 2, inclusive. Particulars and entry forms from the Hon. Organising Secretary, W. N. Plant, 30, Harrow Road, Leicester.

Ilford P.S. Annual Exhibition.—Entries, February 2; open, March 4–9. Hon. Exhibition Secretary, H. G. Haylock, 58, Windermere Gardens, Redbridge Lane, Ilford, Essex.

Birmingham P.S. Annual Exhibition.—Entry forms due, February 9; exhibits, February 12; open, March 2–16. Secretary, E. H. Bellamy, Waterloo House, 20, Waterloo Street, Birmingham.

City of London and Cripplegate P.S. Annual Exhibition.—Closing date, February 11; open, March 11–16.

Exhibition Secretary, J. R. P. Hilliard, 86, Downton Avenue, Streatham Hill, S.W.2.

L.M.S. Annual Exhibition.—Entries, February 13; open, March 11–16. Secretary, A. J. Scrivener, Station Master's Office, Euston Station, N.W.1.

Cannes Photo-Club International Salon.—Entries, February 20; open, March 31–April 7. Entry forms from Secretary, Photo-Club of Cannes, Boite Postale 105, Cannes, France.

Barry C.C. International Salon.—Entries, March 8; open, March 18–23. Secretary, J. H. White, Caerleon, 61, Pontypridd Road, Barry, Glam.

Scottish National Salon (Art Galleries, Ayr).—Entries, Overseas, March 9; Great Britain, March 23; open, April 20–May 4. Secretary, Arthur J. Nelson, 6, Hilary Crescent, Ayr, Scotland.

Brussels International Salon.—Entries, March 15; open, May 7–June 9. Secretary, M. Maurice Broquet, Rue du Sceptre, 77, Brussels, Belgium.

Antwerp International Salon.—Entries, March 15; open, April 27–May 12. Secretary, D. J. de Groote, Van Heystrelt-Straat, 19, Deurne-Antwerp, Belgium.

Hackney P.S. Annual Exhibition.—Entries, March 25; open, March 27–30. Secretary, Walter Selfe, 24, Pembury Road, Clapton, E.5.

Readers' Questions ANSWERED

GENERAL.—All communications for the Editor should be addressed: "The Editor, *The Amateur Photographer and Cinematographer*, Dorset House, Stamford Street, London, S.E.1," and in every case, without exception, must give the name and address of the writer.

CONTRIBUTIONS.—The Editor is glad to consider original, up-to-date manuscripts on photographic subjects. All contributions must be typewritten, or in very legible handwriting on one side of the paper only. Letters or communications arising out of matters already appearing in the paper are not paid for. The Editor disclaims legal responsibility for the safety of matter submitted to him, but he will endeavour to return rejected manuscripts, etc., when a stamped addressed envelope is enclosed. MSS. or prints that are not actually accompanied by a stamped wrapper or envelope can in no case be returned. Reproduction fees for prints are only paid by arrangement beforehand. The sending of a print, without any condition stated, will be taken as permission to reproduce it without fee.

ENQUIRIES AND CRITICISM.—Advice, Criticism and Information are freely given, but the following conditions should be read carefully before applying, as any communication which does not comply with the rules must be ignored.

(1) See "General" above. (2) Every question and every print for criticism must be sent separately through the post, and must be accompanied by a *separate* stamped addressed envelope. No exception can be made in any case to this rule, except so far as enquiries or prints from Overseas are concerned. (3) Neither enquiries nor prints for criticism must be enclosed with competition prints. (4) On the back of each print sent for criticism, in addition to the name and address of the sender, must be the title (if any), and the criticism coupon from the current issue. (5) Enquiries should be clearly written, on one side of the paper only, and should be specific and not general. Such enquiries as "How can I take interiors?" or "Can you give me some hints on outdoor portraiture?" are too general to be dealt with in this section. (6) All envelopes should be distinctly marked "Query" or "Criticism," as the case may be. (7) Prints are sent for advice or criticism on the distinct understanding that by so doing permission is given for their reproduction without fee. We endeavour to deal promptly with enquiries, but cannot undertake to answer by return of post, nor can we give precedence to any enquiry.

A selection of those replies is printed each week, but all questions are answered by post. Enquiries from abroad must contain a coupon also, but it need not be from the current number, and should be cut from the latest issue to reach the enquirer.

M.Q. for Gaslight.

Will you give me an M.Q. developer suitable for developing gaslight prints? S. C. (London.)

With any paper you buy you will find instructions for its use, and these will almost certainly include such a formula. A typical all-round solution for the purpose is:

| | |
|---------------------------|---------|
| Metol | 8 grs. |
| Hydroquinone | 30 grs. |
| Sodium sulphite | 3 oz. |
| Sodium carbonate | 4 oz. |
| Pot. bromide (10 p.c.) .. | 20 min. |
| Water | 10 oz. |

Rytol.

I have seen several references to Rytol as a developer. Can you give me suitable formulae for developing negatives and prints respectively? W. B. T. (Dublin.)

Rytol is a complete developer in itself, and is made in tabloid form by Messrs. Burroughs Wellcome. Any photographic dealer can supply it. The tabloids are dissolved in pairs in a quantity of water suitable for the purpose in hand, and instructions on this point are given on the carton. Fuller information on the use of this developer is contained in the Burroughs Wellcome Diary.

Focal-plane Shutter.

I am told that a focal-plane shutter is more efficient close to the plate than if it is farther away. Why should this be so? One would think that the same amount of light would pass through the slit however far from the plate it was.

T. W. (Bingley.)

We regret that we cannot enter into a lengthy scientific explanation of the efficiency of focal-plane shutters, but you may take it that the fact stated is correct. It may be sufficient if we point out that if you had the focal-plane shutter close behind the lens, using a narrow slit, the full aperture of the lens would at no time be operating.

Medium for Prints.

Some time ago you published a formula for a mixture for rubbing into prints. Can you repeat it? What should I mix with the pigment for darkening? W. I. B. (Sydenham.)

You might first rub the following mixture well into the print with cotton-wool, and afterwards remove as much as possible with clean wool: Mastic varnish one part, linseed oil one part, turpentine two parts. You can then apply the pigment, thinned down either with the same medium or with any other medium suitable for oil painting.

Flashlight Failure.

In the enclosed flashlight group why are all the faces featureless? M. B. T. (Wallingford.)

It is pretty evident that the trouble with your negatives is that the faces were not only exposed to the full effect of the light, but that the amount of powder used caused over-exposure. If you reduce the amount of powder and see that the light does not fall so fully on the faces you should get much better results.

Book for Amateur.

Can you recommend an all-round book giving practical hints on carrying out the various operations undertaken by the amateur?

E. L. J. (London.)

There are many books which would give you the information you want, and we have confidence in recommending "Photography Made Easy," by R. Child Bayley, price 2s. 3d. post free from our publishers.

Finger-Print.

Is it possible to remove a finger-print from the emulsion side of a negative? A. G. J. (Finchley.)

If you mean that the finger-print is due to pressure on the soft gelatine there is no possible means of removing it. In some cases retouching may be a remedy.

Lantern as Enlarger.

Can a standard size projection lantern with a 12-in. lens be used for enlarging from $3\frac{1}{2} \times 2\frac{1}{2}$ negatives? F. C. (Huddersfield.)

Speaking broadly, it is not possible to have any instrument that is equally suitable for enlarging and for projection, as the requirements in the two cases are so different. As the condenser of the lantern will probably cover your negative there is no reason why you should not put such negatives in the carrier. With a 12-in. lens, however, you will find the distances for enlarging are too great to be convenient, and you will probably find also that there is not sufficient scope for adjustment of the illuminant. It would help matters if you substituted for the projection lens a shorter focus lens which would satisfactorily cover the size of negative being used.

Making Slides.

I want to make a collection of lantern slides from my negatives. Should I make them on glass or film? What size should they be?

W. J. H. E. (Ammon.)

You will have to make your lantern slides on proper plates made for the purpose, the size being $3\frac{1}{4}$ in. square. You must get some guidance as to how to set to work, and we suggest that you obtain the N.P. Handbook, No. 6, "Lantern Slides," by Dr. B. T. J. Glover. This is published at 1s., plus postage, and you can get a copy from Messrs. Sands Hunter & Co., Ltd., 37, Bedford Street, Strand, London, W.C.2.

Hardening Prints.

When glazing prints what should be the strength of the alum solution for hardening the prints? How long should the prints remain in the solution? M. H. H. (Godalming.)

We think you will do better to use formalin rather than alum for hardening your prints. Buy some ordinary commercial formalin solution, and use one ounce of this to 9 oz. of water. At the end of the final washing give the prints about three or four minutes in this solution, keeping them moving all the time, and transfer straight to the glazing slabs without further washing. The solution can be used repeatedly.

Modifying Prints.

On the enclosed print you will see that details in the background spoil it. Can you give me a method for removing them? T. A. T. (Derby.)

We should strongly advise you not to attempt to deal with the prints, but to have the modification made by skilful retouching on the negative, a matter which can be dealt with at a reasonable price by a professional retoucher.

Contrasty P.O.P.

Can you recommend a P.O.P., self-toning or not, which is appreciably more contrasty than Seltونا Vigorous? T. H. M. (Sutton.)

It is not practicable to secure the same variation as to soft, normal and vigorous grades with printing-out paper, although it is easy in the case of bromide and gaslight paper. We regret that we know of nothing that will meet your requirements. The only course in this case is to make negatives suitable for the paper.

WINTER CONDITIONS

CALL FOR

WIDE APERTURES

Wide apertures demand very high quality lenses.

ZEISS LENSES

possess that extra quality that means so much, particularly to the miniature camera user, who is faced with the extra handicap of a necessarily high degree of enlargement. Zeiss lenses give crisp enlargements from the smallest negatives.

For Miniature Camera Negatives "PRAXIDOS"

AUTOMATIC FOCUSING VERTICAL ENLARGERS

The PRAXIDOS is an instrument of precision—it is really automatic. There are no wires to break or stretch, no adjustments to make.

No. 502 PRAXIDOS gives 2 to 10 times enlargements from Leica, Contax, Pilot, Kolibri, Rolloroy negatives, and all sizes up to 4×4 cm.

Price, with f/3.5 anastigmat lens. **£14:12:6**

No. 506 PRAXIDOS gives 1 1/2 to 7 times enlargements from any negative up to 6×6 cm., i.e., Rolleiflex, Rolleicord, Superb, etc.

Price, with f/3.5 anastigmat lens. **£15:0:0**

No. 491 PRAXIDOS gives 7 times enlargements from 3 1/2×2 1/2 in. or smaller negatives. Price, with f/3.5 anastigmat lens. **£20:0:0**

CONDENSERS FOR PRAXIDOS ENLARGERS.

REVISED THROUGHOUT AND BROUGHT RIGHT UP TO DATE

PHOTOGRAPHY MADE EASY

By **R. CHILD BAYLEY**
Author of "The Complete Photographer,"
"Hand Cameras," "Photographic
Enlarging"

AS EASY AS A · B · C

This is a book for photographic beginners, and, if carefully studied, it will enable the novice with a camera to get a greater proportion of successful photographs than would usually be the case.

"Photography Made Easy" should be read by everyone taking up photography: it should form as much a part of the outfit as the camera itself: it is an ideal present to give an amateur photographer.

SERIES DISCOUNTS are allowed to Trade Advertisers as follows on orders for consecutive insertions, provided a contract is placed in advance, and in the absence of fresh instructions the entire "copy" is repeated from the previous issue: 13 consecutive insertions, 5%; 26 consecutive, 10%; 52 consecutive, 15%.

All advertisements inserted in these columns must be strictly prepaid and posted to arrive at the Head Office, Dorset House, Stamford Street, S.E.1, not later than first post FRIDAY for the following week's issue, or one day earlier at the Branch Offices, 19, Hertford Street, Coventry; Guildhall Buildings, Navigation Street, Birmingham, 2; 230, Deansgate, Manchester, 3; 258, Renfield Street, Glasgow, C.2. Advertisements are inserted, as far as possible, in the order received, and those received too late for one issue, or crowded out, are published in the first following in which there is space. The Proprietors retain the right to refuse or withdraw advertisements at their discretion.

Posa. Orders sent in payment for Advertisements should be made payable to ILIFFE AND SONS LTD., and crossed

Notes being untraceable if lost in transit should not be sent as remittances.

& Co.

The Proprietors are not responsible for clerical or printer's errors, although every care is taken to avoid mistakes.

BOX NUMBERS.—For the convenience of advertisers, letters may be addressed to numbers at the office of this paper. When this is desired, the sum of 6d. to defray the cost of registration and to cover postage on replies must be added to the advertisement charges, which must include the words "Box 000, c/o 'The Amateur Photographer'." Replies should be addressed: "Box 000, c/o 'The Amateur Photographer,' Dorset House, Stamford Street, London, S.E.1," and these letters will be simply forwarded by us to the advertiser. It must be understood that we do not deal with the correspondence in any other way, nor accept any responsibility in connection with the advertisement. Readers who reply to Box No. advertisements are warned against sending remittances through the post except in registered envelopes. In all such cases the use of the "Deposit System" is recommended.

Special Note

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post. When sending remittances direct to an advertiser, stamp for return should also be included for use in the event of the application proving unsuccessful.

Deposit System

Readers who hesitate to send money to advertisers in these columns may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Amateur Photographer and Cinematographer," both parties are advised of its receipt. The time allowed for decision is three days, counting from receipt of goods, after which period, if buyer decides not to retain goods, they must be returned to sender. If a sale is effected, buyer instructs us to remit amount to seller, but if not, seller instructs us to return amount to depositor. Carriage is paid by the buyer, but in the event of no sale, and subject to there being no different arrangement between buyer and seller, each pays carriage one way. The seller takes the risk of loss or damage in transit, for which we take no responsibility. For all transactions up to £10 a deposit fee of 1/- is charged; on transactions over £10 and under £50 the fee is 2/6; over £50 and under £75, 5/-; over £75 and under £100, 7/6; and on all transactions over £100, one-half per cent. All deposit matters are dealt with at Dorset House, Stamford Street, London, S.E.1, and cheques and money orders should be made payable to Iliffe and Sons Ltd.

CAMERAS AND LENSES

WARNING

We have received many complaints from our readers in regard to the business methods of Mr. R. L. Green, trading as R. L. Green's Photographic Exchange, of 218, Fore Street, Edmonton, London, N.18.

For some considerable time we have refused to insert his advertisements in "The Amateur Photographer and Cinematographer," and from the complaints we have received it would appear that his practice is to communicate with private advertisers having goods for sale, offering to take such goods in exchange for others, or to purchase for cash. Readers are advised to ignore all such offers from this quarter.

CAMERAS AND LENSES

YES, but does it *look* like one? Presentation means more than just giving, it's also the art of making a thing look its best. The right kind of Christmas present is one that is as good as it looks, and looks as good as it is. That describes the Kodak gift set exactly. Ask your dealer for particulars or write to us direct.

**The
PRESENTA
POCKET CINÉ**

Is the neatest and most compact pocket ciné that has ever been produced. No amateur cinematographer who uses 9.5-mm. films can afford to be without a P.P.C. It may be used as a projector, and is a most efficient viewing apparatus for editing 'shots' and for seeing animated pictures without illumination. Slip a P.P.C. in your pocket when you visit your friends and let them see your 'pictures.' The P.P.C. is always at your command to view or screen your films at a moment's notice, without preparation and independent of local conditions.

Rolleicord

With great charm, and without fuss or trouble, the Rolleicord has caught the expression of longing on the little girl's face as she gazes up at the coveted toy.

The Rolleicord is made by the makers of the famous Rolleiflex, and has many features in common with that wonderful automatic camera. Compensation of parallax is fully allowed for. Absolutely rigid focussing mechanism. One-lever Compur shutter for setting and releasing. Patented film guide and many more splendid refinements. The ground-glass screen shows your picture full size, right way up. The separate finder lens enables you to keep your picture in view even during exposure. Takes 12 pictures on $3\frac{1}{2} \times 2\frac{1}{4}$ 8-exposure roll film at 1s.

It is fully equipped for all-round winter photography—indoors or out—and makes a very handsome present—give yourself one to-day.

With Zeiss Triotar f/4.5 lens, **£10:10:0**

Rolleicord Patented Leather Case, £1 extra.

Unusual—'New Angle'—Dramatic pictures
are easy to get with the

"Retina"

**KODAK'S NEW
MINIATURE CAMERA
FOR 35 MM. FILM**

£10.10.0

The Schneider f3.5 lens and "Compur" Shutter (1-1/300th second) free you from hampering restrictions of light and subject. The whole exciting world of night-time photography, for instance, is readily yours with a "Retina"—indoors and out.

The "Retina" is so economical. It gives you 36 panchromatic negatives for 3/6—hardly more than a penny per picture. You can "shoot" freely with the "Retina"—and so multiply your opportunities for getting fine pictures. You can take the "Retina" with you everywhere—it measures only $4\frac{1}{2}$ by 3 by $1\frac{1}{2}$ inches—and snap up the sudden unlooked-for picture chances that wait round every corner.

- How about a "Retina" for Christmas?
- Ask for the free "Retina" Booklet, "The World at Your Finger-Tips."

A KODAK PRODUCT

KODAK LIMITED, KODAK HOUSE, KINGSWAY, LONDON, W.C.2

YOU COULDN'T PRINT A NEGATIVE SIX FEET WIDE

• • • but just imagine if you could . . . think of the wonders it would reveal . . . all the beauties and fascinating detail not seen in small prints, brought out for your admiration and enjoyment.

There is a simple way to see them all, brightly illuminated, brilliantly clear—on ILFORD LANTERN PLATES.

Learn about lantern slide making. Ilford Limited publish a 36-page booklet "The Making of Slides and Transparencies on Ilford Lantern Plates," which they will gladly forward post free. You will then learn how easy it is, and will realise that without this delightful pastime you are missing half the joys of photography.

Christmas Number

GREETING

The Editor wishes every reader, both old and new, in all parts of the world, a Happy Christmas and a Prosperous New Year.

TOPICS of the WEEK

A GAIN Christmas is near at hand and again the familiar formulæ appropriate to the season will be dispensed. Apart from the normal activities of the holiday we hope that our readers will make this a photographic

Christmas. Never before has the camera and all that it means to the keen amateur been so much in evidence at this time of year. Photography in winter-time and snapshots indoors are now within the reach of all. In this, the Christmas number of "The A.P.," many suggestions are given for a

variety of seasonable subjects, and "The Buyers' Guide" may prove an inspiration if judiciously brought to the notice of those best qualified to act on the suggestions it contains.

Owing to pressure on our space this week a number of regular features are omitted, but these will reappear in subsequent issues.

R. CHILD BAYLEY

WHEN in June of the present year R. Child Bayley wrote a reminiscent article of great interest for the Jubilee Number of *The Amateur Photographer*, we did not know that it would be his last contribution to this paper. True, he was then about to retire from the firm of Iliffe & Sons Ltd. after thirty-five years' service, but we felt sure that his remarkable knowledge of photographic matters, both technical and historical, would be available for many years to come.

His death last week, at the age of sixty-five, must therefore have come as a shock to many who knew him as a robust and active worker. Those who knew him more intimately and were aware of his serious illness during the past few weeks will feel the loss no less, as the passing of a friend and of an outstanding personality.

In the photographic world he will best be remembered as the Editor of *Photography*, and, later, of *The Amateur Photographer and Photography*, when the two papers amalgamated. In business R. C. B. was an autocrat, but one who did not spare himself. In private life he was a genial host and an entertaining guest, witty and well informed, with an almost uncanny memory for events and data. He was a great reader, and had well-defined likes and dislikes in the matters of art, the drama, and music, and was a fluent writer on photographic and other topics. He had the gift of easy speech, both in public and private, and could deal with both serious and flippant subjects in a manner that commanded attention. He was a good friend and a fair-minded enemy.

Born near London in 1868, he migrated early to the North, and served his time with a firm of electrical engineers (Messrs. Clarke, Chapman & Co., of Gateshead-on-Tyne). Later he joined the Brush Electrical Engineering Company.

We first hear of him in photographic circles as Hon. Secretary of the Peterborough Photographic Society in 1888. In May, 1892, he was appointed Assistant Secretary to the Royal Photographic Society, a post he held until December, 1898. (In those days the R.P.S. had an Hon. Secretary, elected annually; the permanent official being known as the Assistant

Secretary.) During his period of office he did much good work for the Society, notably to set the R.P.S. museum on a sound footing, and in April, 1898, he organised (for the Society) the International Exhibition of Photography at the Crystal Palace, which was opened by the Prince of Wales.

R. C. B. joined the firm of Iliffe & Sons Ltd. in December, 1898, as Editor of *Photography*. In 1908 *Focus* was acquired, and later, in 1918, *The Amateur Photographer* was also amalgamated. He continued as Editor of the joint papers. In the same year (1918) he was appointed Editor of the "Agricultural Gazette," and in 1924 was made a director of Iliffe and Sons Ltd.

In July, 1925, on the acquisition by this firm of *The Farmer and Stockbreeder*, he was appointed Managing Director of Macdonald & Martin, Ltd., but continued his interest in photography as Consulting Editor of "The A.P." In 1931 he also became Managing

Director of "Electrical Review, Ltd.," thus coming back to the field of his earliest work.

During his very active life he has been interested in many movements in photography, notably "The Free Camera Club," which he founded in 1901 to champion the British photographic trade v. Messrs. Kodak, Ltd. He was the first to bring Autochrome plates to this country from France in 1907.

He was elected an Honorary Fellow of the Royal Photographic Society in 1924.

ROGER CHILD BAYLEY.
Died November 29th, 1934, aged 65.

The "Present" Problem

The best Christmas present is a photographic one, whether for the photographer or the photographer-to-be. In this article suggestions are offered which will assist those in doubt "what to give."

NOW is the time when the question of the selection of most suitable gifts for relatives and friends becomes a serious problem. The photographer is very happily situated in this respect, for the range of possible presents photographic in character is almost unlimited in variety and price. There is, above all, the opportunity to introduce the delights of photography to those who are not possessors of cameras. This may be done quite inexpensively. The gift of apparatus or material will widen the scope and quicken the interest of those who are already photographers. A suitable gift of this sort will not only be appreciated, but will not lie forgotten in some drawer, the fate of so many Christmas presents that have been chosen unthinkingly.

A Wide Range.

For those who are already photographers the gift may range from one of a few shillings in value to many pounds. At no time in the history of photography has the available selection been wider. If within the capacity of our pocket, we may choose a miniature camera, as supplementary to existing apparatus, an enlarger, or a telephoto lens.

Amongst photographic accessories we may suggest a tripod, an exposure meter, a set of light filters, a good dark-room lamp, or one of the modern lighting outfits for home photography. Most amateurs would be grateful for the last, which would provide opportunities for picture-making at home during the festive season. If the photographer's equipment is known to be fairly complete, there is still the suggestion that a supply of plates, films or papers, or an outfit for colour photography, would prove acceptable. Apart from still photography, a motion-picture outfit, of which there are so many at all prices now on the market, would come as a joyful surprise to the recipient.

Making Real Photographers.

There are many camera users who hand their films over to the D. & P. establishment for finishing. The keen photographer realises that these "amateurs" are losing half the joy of their hobby. Through the gift of a developing tank, or the necessary apparatus, and material for development in the dark-room, and for making prints, with the necessary instructions, there is a good chance that the casual snapshotter will become a photographer in the true sense of the

word. Many would like to do their own work, but are shy of making a start; but if the apparatus and material are placed in their hands the rest is assured, and they will speedily join the ranks of the keen workers.

It is safe to say that almost every boy or girl longs for a camera. Here is an opportunity to supply the want. At most schools photography is encouraged by the powers that be, who fully realise its value. Records collected of the incidents and personalities of school life become increasingly valued as the years pass.

It may be that the boy or girl is already possessed of a camera, but great delight will herald the advent of a better one, or an instrument of wider capacity. It is a mistake to imagine that "anything will do." If the needs in the matter of apparatus are fully met, a supply of plates or films and some printing paper will be appreciated, for no boy or girl has enough for all the pictures that they want to take, and the cost of these do make rather an inroad on juvenile pocket-money. So let the gifts for the young people have a photographic character.

Even if the recipient is not attracted to photography the photographer still has in his hands a means of making a gift with a distinctly personal touch. A carefully-finished enlargement from a negative of a subject which is known

to interest the recipient, suitably mounted, and perhaps neatly framed, is certain of appreciation.

Portraits, family groups, holiday incidents, all offer possibilities in this respect, and at a low cost. If the photographer cannot do the work himself it may be handed to a dealer. These gifts have a value of their own, and they cannot be given by any but the photographer himself.

The keen photographer reads all the literature that he can get dealing with his hobby. Therefore any gift which takes the form of good photographic literature will be acceptable. There are a number of useful books published from "The A.P." offices. A complete list of publications will be sent on request.

Apart from these the photographer whose tastes lean towards the pictorial will delight in the current copy of *Photograms of the Year*, which is not only a record of the best work, but provides many a keen worker with a stimulating effort towards better work. It may suggest other fields of pictorial activity.

Lastly, if the photographer is not a regular reader of "The A.P." a year's subscription to the journal is an ideal Christmas gift. It will be assured of a welcome, and will serve as a link with the donor, every week.

THE BUYERS' GUIDE

In the following "Buyers' Guide" many varieties of photographic apparatus, accessories and sundries to suit all pockets are described. Articles that are illustrated in the text are indicated by an asterisk. The addresses of the firms named will be found in our advertisement pages. In nearly every case illustrated catalogues are available, and will be sent post free to readers who mention "The Amateur Photographer" in their letter of application. It is suggested that readers should hand a copy of this issue to potential donors of Christmas presents, and make a cross against any item that is desired.

Actina, Ltd.

The "Lilliput" Tripod, that when closed is only 7 inches in length, as long as the average man's hand, and weighs only 10 oz., would be a most suitable gift for any owner of a camera, the cost being 21s. The "Dolly A,"* that takes 16 pictures on standard V.P. roll film, has Xenon f/2 anastigmat in Compur shutter, and costs £13 17s.

Other models, costing £5 12s. 6d. and £3 15s., are available, so that the choice of these cameras for gift purposes is very wide.

Amateur Ciné Service.

The "Amaciné" Transformer,* the great current saver, would be highly

appreciated. For Pathéscope Home Movie the cost is 25s., for Pathéscope 200-B and Paillard-Bolex models C.D., D.A. or P.A. 35s., for Paillard G.916 50s., and for 750-watt Bell & Howell 80s. Quotations for other models will be sent on receipt of particulars.

Agfa Photo, Ltd.

The "Speedex O" Folding Roll Film Camera,* for pictures $2\frac{1}{2} \times 1\frac{1}{8}$, will be accepted by any amateur with the utmost pleasure. With f/5.6 Igestar anastigmat in delayed-action Compur shutter, it costs £5 5s., or, with f/3.9 Solinar anastigmat with similar shutter, £8 15s. For those already owning one of these beautiful little instruments a Portrait Attachment costing 10s. 6d. would make a

suitable gift.

Aldis Brothers.

The Aldis f/4.5 Anastigmat, at £4 10s., is a suggestion that would be acclaimed by any photographer who has never enjoyed the use of these excellent lenses.

Camera Craft, Ltd.

A suggestion for an acceptable gift is a subscription to this firm's 9.5-mm. library of super feature films. For 15 reels the price is £1; 30 reels, £1 12s. 6d., and 50 reels, £3.

M. Alton.

The "Alton" Auto-focus Vertical Enlarger* has Dallmeyer f/4.5 anastigmat, and all models can be used for reduction to V.P. size. The price of the $3\frac{1}{2} \times 2\frac{1}{2}$ Model A is £7 12s. 6d., and $\frac{1}{4}$ -pl. Model A £8 12s. 6d. These enlarge to 12×10 and 15×12 respectively. The Models B enlarge to 18×15 and 20×16 , and each costs 15s. 6d. extra. The "Alton" for Leica enlargements costs £4 and £5 17s. 6d., according to the size of the enlargement.

Burroughs Wellcome & Co.

The 1935 edition of the ever-popular "Wellcome" Exposure Calculator, Handbook and Diary* would make a most acceptable extra gift to any photographer. Besides the exposure factors, there is a section devoted to miniature camera technique. There are also special articles for the ciné and colour workers. The price is 1s. 6d.

Zeiss Ikon Cameras as Christmas Gifts are acceptable and practical

CONTAX

The supreme universal camera. It has metal focal-plane shutter, giving exposures from $\frac{1}{2}$ to $\frac{1}{1,000}$ th second and Time. Long base accurate range-finder; open construction of back, easy to clean and load. Zeiss lenses, apertures from $f/1.5$ to $f/8$. Focal lengths from $1\frac{1}{4}$ in. to 12 in.

Price, with Zeiss Tessar $f/3.5$..£27 10 0 Price, with Zeiss Sonnar $f/2$..£35 10 0

BOX TENGOR

The Aristocrat of Box roll-film cameras. The ideal instrument for amateurs wanting a really good camera at a low price. Takes 16 pictures $2\frac{1}{2} \times 1\frac{1}{2}$ in. on usual $3\frac{1}{4} \times 2\frac{1}{4}$ in. spool, also in other sizes. Made of metal, GOERZ Frontar lens $f/11$ —nearly double the rapidity of the lenses of most box type cameras.

Price, $2\frac{1}{2} \times 1\frac{1}{2}$ in.£1 2 6
 $3\frac{1}{4} \times 2\frac{1}{4}$ in.£1 5 0

IKOFLEX

The new Zeiss Ikon Twin-lens Reflex for 12 $2\frac{1}{4} \times 2\frac{1}{4}$ in. pictures on the usual $3\frac{1}{4} \times 2\frac{1}{4}$ in. spool. The image is seen on the ground-glass screen the right way up and in its actual size. Two high-class anastigmats are used of precisely the same focal lengths and apertures. Main features are: (1) Full-size view-finder; (2) depth of focus scale; (3) large finder lens; (4) film-winding lever.

Price, with Novar $f/4.5$ and Ikoflex shutter £7 10 0

SUPER NETTEL

Takes $1\frac{1}{8} \times 15/16$ ths in. pictures (24×36 mm.) on ciné film. Automatic focussing by distance meter, metal focal-plane shutter from $\frac{1}{5}$ th to a guaranteed $\frac{1}{1,000}$ th second. Zeiss Tessar $f/3.5$ or $f/2.8$. Takes Contax spools. Hinged baseboard protects lens.

Price, with Zeiss Tessar $f/3.5$ £21 12 6

Price, with Zeiss Tessar $f/2.8$ £23 10 0

TRONA

Double extension model with Rapid Zeiss Tessar $f/3.5$, for Plates or Film Packs. With the Trona one can give the short exposures required for objects in rapid movement. Will take portraits in ordinary rooms without aid of extra lighting, and for snapshots out of doors the light almost ceases to be a factor.

Price, with Compur shutter and three slides, $3\frac{1}{2} \times 2\frac{1}{2}$ £18 12 6

SUPER IKONTA

for roll films. Also in the two larger sizes for 16 pictures, by using mask supplied. Famous as the camera that does the focussing. The Distance Meter enables the user to get the correct distance by the simple rotation of a knob, at the same time setting the lens to that distance.

Price, for 16 pictures: $2\frac{1}{2} \times 1\frac{1}{2}$ in., Tessar $f/3.5$ £16 12 6

Eight pictures (or 16 divided): $3\frac{1}{4} \times 2\frac{1}{4}$ in., Tessar $f/4.5$ £17 0 0
 $4\frac{1}{2} \times 2\frac{1}{2}$ in., Tessar $f/4.5$ £18 15 0

NETTAR

is everybody's EVER-READY roll-film camera—for $3\frac{1}{4} \times 2\frac{1}{4}$ in. roll films, 8-exposure spools. Equipped with rapid anastigmats and self-opening by pressing a button. The Zeiss Ikon "two-dot" system makes possible sharp pictures without special focussing by simply adjusting focus and diaphragm to respective dots.

Price, with Novar $f/6.3$ £3 10 0

Price, with Novar $f/4.5$ £5 5 0

IKONTA

Most modern of all automatic-opening roll-film cameras. It provides a wide range of optical equipment and contains the Zeiss Ikon "red-point" focussing feature. Self-erecting front, compact design, beautiful finish and first-class equipment. Four sizes.

Prices, with Tessar $f/4.5$ and Compur shutter:

Baby ($1\frac{1}{8} \times 1\frac{1}{4}$ in.)£8 17 6
 $2\frac{1}{2} \times 1\frac{1}{2}$ in.£10 0 0
 $3\frac{1}{4} \times 2\frac{1}{4}$ in.£11 5 0
 $4\frac{1}{2} \times 2\frac{1}{2}$ in.£12 15 0
Other prices from£3 7 6

Ask your dealer or send a postcard direct to us for lists and further information of any Zeiss Ikon camera mentioned in this announcement.

ZEISS IKON LTD.

11, MORTIMER HOUSE, MORTIMER STREET, LONDON, W.1

MAKE IT A DALLMEYER GIFT

Dallmeyer products have been before the public for over three-quarters of a century, during which time they have been acclaimed the finest in the world.

OPTICAL BENCH TITLING OUTFIT

Any make of 8-mm., 9½-mm. or 16-mm. amateur ciné camera can be used; straight titles—animated running titles—trick titles, can all be made. 480-watt illuminant enables pictures to be taken at f/4, 16 pictures per second. A fount of over 400 specially prepared white felt letters allow all variations of titles to be set up. £8 8s.

NEW "POPULAR" TITLING OUTFIT

Accommodates any make of 8-mm., 9½-mm. or 16-mm. ciné camera. A universal and efficient Titling Outfit selling at a popular price. Complete with 200 white felt letters, blackboard, and two 40-watt coil-coiled lamps or the illuminant. £3 3s.

THALHAMMER TRIPODS

The Kino-Pano-Tilt and Tripod suitable for use with all makes of ciné cameras. Built of hardwood, metal fittings and legs. Allows vertical tilting angle of 130 deg., and complete turn of panoram. Will hold 100 lb. Model B.L., £10; JUNIOR MODEL, £6 10s.

CRAIG SPLICER AND REWIND

Operates in the same direction as the film is wound, simplifies rewinds and splicing. Mounted on oak board 32 in. long, complete with Craig De Luxe Rewind and Craig Splicer. £6 6s.

MODEL 5 VICTOR CINÉ CAMERA

The very finest amateur ciné camera manufactured. Very latest movements, turret front, visual focussing, 4 speeds and slow motion, back-turn for lap dissolves, compensating finder, etc. With Dallmeyer 1-in. F/2.9 Triple Anastigmat Lens in Micro Foc. mount. £50

BLENDEX EXPOSURE METER

A useful gift for your ciné friend. Makes sure of dead accurate exposure for every shot that's made. Supplied in ever-ready leather case with instructions and tables.

No batteries. Nothing to renew. £4 4s.

"VICTOR" CINÉ PROJECTOR

Model 20 Projector, 750-watt lamp, spring-loaded double-claw, preventing damage to films, reverse, automatic rewind, etc., etc., and automatic film trip. With 2-in. Dallmeyer Max-Lite Projection Lens. £60

Your ciné friend will appreciate the efficiency and sound workmanship of any Dallmeyer gift, whether it be the smallest accessory or the largest piece of apparatus.

DALLMEYER TELEPHOTO LENSES

for 8-mm., 9½-mm. and 16-mm. ciné cameras. For obtaining large-scale images of distant objects. Made from 1½ to 12 in. focal lengths, with apertures from F/3.3 from. £4 4s.

DALLMEYER SUPERLITE LENSES

An entirely new departure in projection lens design. The picture projected is brilliant in the extreme, being 25 per cent increase over normal lenses. 2 to 4 in. focal lengths. £5 5s.
F/1.8 series, 1, 1½ and 2 in. focal lengths. £3 3s.
For all 8-mm., 9½-mm. and 16-mm. projectors.

CRAIG SENIOR SPLICER

A really efficient and automatic 16-mm. Splicer. Cuts, scrapes and joins in but three simple operations. £3 3s.

DALLMEYER TRANSFORMERS

Stocked in suitable types for all makes of ciné projectors. The most economical apparatus for stepping down the ordinary lighting current to suit your projector. Compact, clean and robust construction. Working without heat or wastage. For A.C. mains, 550 watt, £4; 850 watt, £7 10s.; 1,000 watt, £10.

DALLMEYER DUPLEX REWIND

Rewind arms made from aluminium castings. Geared 3 to 1, silent and smooth working. Take from 50 to 400 ft. standard reels. Rewinds are screwed to oak baseboard, fitted with rubber studs to prevent slipping. Baseboard is 2 ft. 6 in. by 6 in. Complete, £2

YOUR DEALER STOCKS DALLMEYER PRODUCTS. Write for illustrated Catalogues and full particulars from:

J. H. DALLMEYER, LTD.
31, MORTIMER STREET, LONDON, W.1

Works: Dallmeyer Road, N.W.10.

Phones: Museum 6022/3.

The Camera Co.

The "Vauxhall de Luxe" Roll Film Camera,* fitted with f/2.9 Meyer Trioplan anastigmat in delayed-action Compur shutter, takes 16 pictures on $3\frac{1}{2} \times 2\frac{1}{4}$ film, has reinforced bakelite body, and costs £5 19s. 6d. Undoubtedly a very welcome find in anybody's stocking. For those owning 200-B Pathéscope Projectors, the special

carrying-cases for 6 reels, projector and resistance at 17s. 6d. would be very acceptable.

Carl Zeiss (London), Ltd.

The prismatic theatre glasses made by Carl Zeiss afford the ideal method for viewing stage performances, as the field of view is so extensive. The two models are the "Theatis" at £12 13s., and the "Yeaba,"* a de luxe edition of the former. This has gilt metal fittings,

fine brown leather covering with leather case to match, and costs £16 4s. A gift within the reach of many pockets is the Zeiss Table Barometer at £3 3s. This would keep the donor constantly in mind. If friends are already owners of Zeiss lenses, a gift of Distar or Proxar auxiliary lenses would be acceptable and not too expensive.

Coronet Camera Co.

The "Coronet Golden Caskets" form admirable gifts for the festive season. Casket F.P.* contains a Coronet folding

roll-film $3\frac{1}{2} \times 2\frac{1}{4}$ camera, with focussing scale, and carrying-case with lock and key, in a handsome casket, the price

being 21s. Casket B contains Coronet $3\frac{1}{2} \times 2\frac{1}{4}$ roll-film box camera, with waterproof tan case, at 10s. 6d. The caskets make handsome glove or tie-boxes.

Cinex, Ltd.

If Father Christmas or a fairy

god mother wishes to give unalloyed joy, a parcel containing a Paillard-Bolex Projector would be certain to achieve the desired end. Model P.A. for 9.5-mm. costs £24. Model G.916,* for both 16-mm. and 9.5-mm., costs £49 10s., while the Paillard Mono K.8,

for the new 8-mm. film, costs £24.

City Sale & Exchange (1929), Ltd.

The "Salex Supreme" Self-erecting $3\frac{1}{2} \times 2\frac{1}{4}$ Roll Film Camera,* with f/4.5 Meyer anastigmat in three-speed shutter with delayed action, at 59s. 9d., will provide a most acceptable gift and extremely good value for the money expended. The "Salex de Luxe" $3\frac{1}{2} \times 2\frac{1}{4}$ Folding Pocket Plate Camera, with f/3.8 Meyer anastigmat in delayed-action Compur shutter, costs £6 15s. 9d., and will prove most acceptable to anyone who appreciates a good camera.

Criterion, Ltd.

A parcel of Criterion Plates or Papers would be a particularly attractive gift. The R.S.O. 450 H. & D. is a suitable plate for amateurs, a faster one being the 700 H. & D. grade. Mezzotone Lantern Plates would be welcomed by any slide-maker; whilst Mezzotone Paper for the pictorialist or Bygas for the novice would be welcomed. The Criterion Printing Outfit, consisting of two dishes, 25 sheets of $3\frac{1}{2} \times 2\frac{1}{2}$ Bygas, printing frame, developing and fixing salts and full instructions, can be obtained for 3s., and would be a most suitable gift for any beginner.

J. H. Dallmeyer, Ltd.

So many very attractive articles suitable as presents are being offered by this old-established house that it is only possible to mention a small proportion of them. The new "Popular"

Titling Outfit,* complete with lamps and letters, for use with all makes of ciné cameras, 8, 9.5 or 16 mm., at

£3 3s., would appeal to all ciné users, as would the "Blendux" Photo-electric Exposure Meter at £4 4s.

Dollond & Aitchison, Ltd.

A gift that would be unusual would be one of the Dollond Spectacle-form Theatre Glasses. These are worn just like spectacles, and once focussed do not need any attention. They obviate the necessity

to keep raising the glasses to the eyes, and cost only £2 5s. Prismatic Binoculars are, of course,

by far the best, and are always acceptable. Messrs. Dollond are offering the "Imperial" 8x25, with central screw focussing, at £4 4s., the 12x30 high-power "Lumina" at £4 10s., and the wide-angle, high illumination "Standard" 8x32* at £7 10s.

Drem Products, Ltd.

The extinction exposure meters, for which this firm is famous, would all make very acceptable gifts. The new

"Justodrem" Meter* will achieve immediate popularity, as its cost is only 15s. The "Justophot," which has been a popular favourite since 1924, costs 35s. A cheaper model is the "Dremoscopy," which, like the "Leicascop," "Contaxscop," and "Cinemeter," costs 30s. A present that would appeal to all amateurs who make enlargements is the "Largodrem," which enables exposures to be calculated with remarkable accuracy, the price being 30s. The "Largodrem" Speed Tester for bromide papers costs 3s. 6d., an inexpensive and useful adjunct to a dark-room.

Ensign, Ltd.

The Ensign "Silver Midget" will probably be widely given in this year's Christmas presents, as it is most attractively designed, not only in itself but in its presentation case. The camera is contained in a silver-grey leather pocket

case, the whole being included in a velvet-lined jewel type padded box. In addition, the exterior packing is a

specially-made postal box with sealing band. Model S/33, with all-distance lens, costs 33s., and Model S/55, with Ensar f/6.3 anastigmat, only 55s.

Fixol and Stickphast, Ltd.

mounting album or packet or two of printing paper.

A. W. Gamage, Ltd.

Two lines eminently suitable as Christmas gifts are offered by this famous house. The "Long-champ de Luxe" 8x dust and damp proof Prismatic Binoculars, with 25-mm. object glass, at 49s. 6d. will prove acceptable to any photographer, naturalist or racegoer. A very attractive and inexpensive line is the solid oak Circular Barometer,* which has antique silver-effect dial and chrome bezel and setting hand. This, complete with forecast chart, costs 9s. 11d. only.

Edwin Gorse.

The new Ciné Walking-stick Stand, which extends to eye-level and is remarkably steady in use, would make a doubly useful gift, as it would enable the recipient to employ it as an adjunct to help his walking when in search of subjects, and as the camera stand when the desired viewpoint has been found. It is priced at 45s.

Garner & Jones, Ltd.

The "Multi-speed Roll Film Exakta" Camera,* a reflex with focal-plane shutter speeded from 12 to 1/1,000th sec. and delayed action, is a gift that would make an immense impression. The price, with Ihagee f/3.5 anastigmat, is £14; or with f/2.8 Zeiss Tessar, £26. A very low priced but useful accessory would be the "Stabilo" Tripod at 12s. 6d. The new "Labora" Roll Film Developing Tank, at 25s., would also be acceptable to any owner of a film camera.

Gevaert, Ltd.

A gift of some packets of the new "Gevaluxe" Paper, that was so much in evidence in the autumn exhibitions this year, would not only cause delight, but would introduce the recipient to an entirely new conception of printing excellence. In 8 1/2 x 6 1/2 size it costs 4s. 6d. for 6 sheets, or 8s. 9d. per dozen, and in 12 x 10 9s. 9d. and 19s. respectively. Some spools of roll film or of 9.5 or 16 mm. ciné film would also please "still" and ciné amateurs respectively, while Gevaert Lantern Plates would be useful to society members contemplating the preparation of lecture sets.

Harbutt's Plasticine, Ltd.

Harbutt's "Plasticine" is so well known that the name has become a household word. Its uses are multifarious, and every photographer should have a supply available. Harbutt's "Plastone" is not, however, nearly so famous, yet it has the plastic nature of "Plasticine" but becomes stone-hard upon drying. With it, many delightful articles may be made and kept for permanent use or decoration. It can be painted with oil-colours and makes such attractive articles as book-ends or statues. The price is 7d. per 1/4 lb., and 1s. 9d. per lb. A special "Designer" Box, containing all necessary tools, is obtainable at 6s. 3d., post free, and would make a most acceptable gift.

R. F. Hunter, Ltd.

The new "Rolleicord" Camera, that takes 12 pictures 2 1/4 x 2 1/4 on ordinary 3 1/4 x 2 1/4 roll film, and has f/4.5 Zeiss Triotar anastigmat in Compur shutter, will undoubtedly appear in many Christmas parcels this year, the cost being £10 10s. Its elder and more luxurious brother, the "Rolleiflex,"* is almost too well known to need description. Its price, £20, with f/4.5 Zeiss Tessar, or with f/3.8, £22 10s., will naturally restrict it from being widely given away, but to those who can afford

to give a present that will afford lifelong delight, this famous camera can be purchased with every confidence.

Ilford, Ltd.

A gift ever welcome to a photographic friend is a supply of plates, films, or printing paper of the size usually used. Non-photographic friends can ascertain the size required by taking one of the friend's photographs to a dealer and asking for a roll of Selochrome or a packet of Ilford Special Sensitive Panchromatic Plates. Two new introductions are the Selo Fine-Grain and Hypersensitive Panchromatic Roll Films. Another suggestion is a gift of Dark-room Safelights at 5s. 6d.

Illustra Enterprises.

The "Illustrachrome" Colour Wheel, which enables projections to be made with a great variety of colour, will, until Christmas, be fitted free to every projector sold by this firm, irrespective of the cost. Projectors may be secured for as little as 25s., but, nevertheless, the "Illustrachrome," costing 6s., will be included. At the price stated a model to fit all projectors can be obtained and would be welcomed by any owner of a ciné projector. "Illustrascreens," which have highly reflective silver surfaces and are mounted on rollers and battens, cost 20s. for the 30 x 40 in. size, 25s. for 36 x 48, and 55s. for 48 x 60. Any size can be made to order at 2s. per square foot.

Johnson & Sons, Ltd.

One of the most acceptable gifts to a new photographer is offered in Johnson's Home Photography Outfit,* which contains all apparatus and chemicals for developing films or plates and making prints. The contents are a dark-room lamp, 2 dishes, 4-oz. measure, printing-frame with glass, thermometer, combined album and negative wallet, a bottle of Azol for plates or films, 3 packets of M.Q. developer for gaslight paper or films, a packet of amidol developer for bromide papers, tin of acid fixing and full instructions. The whole is packed in a cardboard storage box and costs only 8s. 6d.

L. A. Leigh.

The new "Ultrisorban" Filters would prove eminently suitable gifts to photographers. The correction they afford is remarkably effective, and as prices range from 6s. 6d. for a lens mount 21-mm. in diameter to 16s. 6d. for 51-mm. the cost of the present would be small. The "Fesagol" Developers, especially the "Fesagol B" which gives a rich brown

tone by direct development, would prove popular. The prices are 2s. 4d. and 3s. 6d.

Kodak, Ltd.

The "Retina" Camera,* introduced only three weeks ago, will figure prominently amongst the gifts. This brilliant newcomer to the miniature list holds 36 exposures on 35-mm. perforated film, has Schneider 'Xenar' f/3.5 anastigmat in Compur shutter speeded to 1/300th sec.,

automatic film-counting device, optical direct-vision view-finder, and loads and unloads in daylight. The size when folded is only $4\frac{1}{2} \times 3 \times 1\frac{1}{2}$ in., and thus it can easily and unobtrusively be carried in handbag or pocket. The workmanship and finish are excellent, and at the popular price of £10 10s. it will make an immediate appeal.

E. Leitz (London).

The Model III Leica is, of course, the present *par excellence*. The price is £27 in black finish, or £28 4s. in chromium. This camera has a built-in range-finder coupled to the focusing mount of the lens, which at the price quoted is f/2.5 Elmar anastigmat. A valuable adjunct is the small Collapsible Copying Stand, specially intended for travelling. Including case, this costs £4 13s. The Leica Stereo-front "Stereo-ly" Attachment,* available for use with all 5-cm. Leica lenses, enables stereo pictures to be made of still or moving objects, and transposing when printing the negatives is unnecessary. The price is £6 13s. 6d., and the viewing apparatus £7 5s.

Modern Traders, Ltd.

The "Matélux" Lamp* that has become so popular would provide a welcome addition to the equipment of any photographer, and should prove most useful in making photographs of Christmas parties at night. The complete outfit, comprising aluminium floodlight reflector, adjustable table stand, shock-resisting bakelite handle

with press button switch control, costs only 42s. A movable stand outfit, consisting of three lamps in parallel, costs £6 17s. 6d.

W. H. McKaig.

A most acceptable gift would be a

Watkins "Bee" Exposure Meter,* which would enable beginners to secure correct exposures of all their films. The price is 5s. For more advanced workers, there are the Colour Plate, Indoor and

Studio Meters at the same price, and the small Ciné Meter at 7s. 6d.

Miscellaneous Trading Co., Ltd.

The small Microscopes offered by this firm would make excellent and most unusual gifts. The cheapest model, which has inclinable joint sliding tube focus with a magnification $\times 25$, costs 5s. Other models, $\times 50$, cost 9s. 6d. and 12s. 6d. That priced at 9s. 6d.* is very useful, quite apart from its other uses, for examining negatives, residues of solutions, crystals, etc.

Norse Trading Co. (London), Ltd.

The "Baldax" Cameras at £3 15s., with f/4.5 Vidanar anastigmat in Vario shutter, or at £7 7s. with f/3.5 Meyer Trioplan in Compur shutter, would be highly appreciated, as would the 3×4 cm. Piccochic at £3 7s. 6d. and £7 5s. with the same optical equipments.

The "Perplex" Universal Developing Tank,* for all sizes from 12-exposure Leica film to $2\frac{1}{4} \times 4\frac{1}{2}$, at 25s. would immediately appeal to all roll-film camera users.

Radio-Aid, Ltd.

Have you any deaf friends? If so, the most acceptable gift would be the entirely new and excellent portable unit for the deaf—the "Radio-Aid" Midget Amplifier. This enables those so unfortunately afflicted to hear without strain. It measures only $9 \times 4 \times 3$ in. and is complete in every detail. There is a choice of headphones, one with a headband and the other with a spring clip that fits comfortably and unobtrusively behind the ear, and the price with either model is 20 guineas. What a boon for some unfortunate deaf friend

if he or she were to receive this at Christmas.

Peeling & Van Neck, Ltd.

The "Foth-Derby" Camera will be widely sought for in the gift class. This takes 16 pictures on V.P. roll film, has a focal-plane shutter speeded to

1/500th sec., and costs £4 12s. 6d. with f/3.5 anastigmat, or £7 5s. with f/2.5. The "Foth-Flex"* is a twin-lens focal-plane reflex, and costs £10 7s. 6d. with f/3.5 anastigmats. The "Welta" Cameras are too numerous to detail, and a list should be obtained.

Perhaps the most novel of these is the "Welta-Perfekta," a 6×6 cm. folding twin-lens reflex with price with f/3.5 Trioplan anastigmat being £13 10s.

Photric Products.

Two inexpensive gifts are offered by this firm. The "Autosiphon,"* which instantly converts a lavatory basin into an effective washer for plates, films or papers. It is used in place of the ordinary waste plug, and the larger sizes allow enlargements to be washed efficiently in a bath or sink. The price is 1s. 8d., post free, under $1\frac{1}{2}$ -in. plug, and 2s. for $1\frac{1}{2}$ -in. and over. Another line is the "Filmtainer," which is a neat moulded case for two spare or exposed $3\frac{1}{4} \times 2\frac{1}{4}$ film spools. It is dust,

damp and light proof, and is supplied in either polished "oak" or "walnut" finish at 1s. 8d. post free.

Presenta, Ltd.

The "Presenta" Pocket Projector* for 9.5-mm. ciné films, costing 25s., would make an ideal present for ciné workers

in that size. It can be used for visual viewing, or can project by means of a dry battery. It has a bakelite case, and is obtainable in four colours, black, walnut, jazz and mottled green.

Sands Hunter & Co., Ltd.

Undoubtedly the new "Optichrom Automat" Roll Film Daylight Developing Tank* will prove one of the most popular gifts this Christmas. It is available in two sizes: No. 1 for films $2\frac{1}{4} \times 2\frac{1}{4}$ or $3\frac{1}{4} \times 2\frac{1}{4}$, and No. 2 for $1\frac{1}{2} \times 1\frac{1}{8}$ or $2\frac{1}{2} \times 1\frac{1}{2}$, the price in each

case being £1 15s. This tank was extensively reviewed in our issue dated 14th November, to which prospective buyers are referred for further details.

Schering, Ltd.

The Voigtlander "Brilliant" Cameras* are a most suitable line for seasonable greeting purposes. These cameras have full size view-finders. That with f/7.7 Voigtar anastigmat costs 45s. The model illustrated with f/6.3 anastigmat costs £4 5s., whilst yet another instrument fitted with f/4.5 Skopar anastigmat in Compur shutter is obtainable for £6 5s.

The Service Co., Ltd.

The "Service Gem" Camera, taking 16 pictures on $3\frac{1}{4} \times 2\frac{1}{4}$ roll film, is a good suggestion for a present. It has f/2.9 Steinheil Casar anastigmat in delayed-action Compur shutter, and reinforced bakelite body. It costs £5 19s. 6d. A fine $3\frac{1}{2} \times 2\frac{1}{2}$ double extension plate camera is the "Service Superb," with f/2.9 Meyer Trioplan anastigmat in delayed-action Compur shutter, at £9 17s. 6d. Some inexpensive lines are the Junior Microscopes. The 30x costs 6s., 100x 12s. 6d., and 150x 17s. 6d.

Henry C. Stephens, Ltd.

A mountant that has been before the public for a very long time is "Grip-fix." This has recently been packed in an automatic container. The

paste exudes through a series of very narrow slots in the top plate, thus affording just sufficient paste to adhere to the brush without waste. Mountant is always acceptable to any photographer,

and this packing may be obtained for 2s. in aluminium container,* or 2s. 6d. in gold finish. "Grip-fix" is also sold in aluminium containers at 9d. and 1s. Any maker of lantern slides would welcome some lantern plates, binding strips and "Grip-fix," as experience has shown that gummy binding strips invariably hold more tightly if they are brushed with mountant.

The Thornton-Pickard Manufacturing Co., Ltd.

A gift of the new patent "Stevens' Screen" would be highly appreciated by any owner of a reflex camera. This invention takes the place of the usual top focussing screen on a reflex camera, and costs 21s. in $3\frac{1}{4} \times 3\frac{1}{4}$ size. By using this new screen the illumination is enormously increased, thus facilitating focussing, especially in a poor light. It can be used on all T.-P. horizontal reflexes

without alteration, and can be used on nearly every $3\frac{1}{2} \times 2\frac{1}{2}$ reflex. It can also be supplied to fit all old or new T.-P. $\frac{1}{4}$ -plate reflex cameras at 30s. Undoubtedly a most welcome gift to all such owners.

Thorsch & Co., Ltd.

The K.W. Reflex Box Camera* is bound to be acceptable, as it enables those who have never experienced the delights of a reflex to cultivate the experience at a very low cost. For £3 3s., Model 900, with f/6.3 anastigmat, fitted with rotating stops, can be secured, whilst Model 905, with Steinheil Actinar iris diaphragm

f/4.5 anastigmat, with

and other fittings, may be purchased for £6 6s.

Taylor, Taylor & Hobson, Ltd.

Undoubtedly a welcome addition to any photographer's outfit would be one of the famous Cooke Aviar Lenses, for which the makers claim that throughout the plates for which these lenses are listed the definition is superlative. As an example of prices, the Series II f/4.5 to cover 5×4 plate costs £8 10s. in either standard or sunk mount.

The Westminster Photographic Exchange, Ltd.

The "Westminster" Ciné Tripod, the legs of which are extensible to give a height of 50 in., and have a reversible

foot, one end having a spike and the other a rubber buffer, would be welcome to any ciné operator, the price being £4 17s. 6d. The "Victoria" Roll Film Camera,* taking 16 exposures on $3\frac{1}{4} \times 2\frac{1}{4}$ film, is self-erecting

and spring-opening, has bakelite body, delayed-action Compur shutter and Meyer Trioplan f/2.9 anastigmat, at a cost of £5 15s. A cheap present would be the "Westminster" Adjustable Masking Board, for use in enlarging. It has adjustable masks for all sizes to 10×8 , and a strong wooden base, and is available for 21s.

Zeiss Ikon, Ltd.

The new "Ikonflex" $2\frac{1}{4} \times 2\frac{1}{4}$ Twin-Lens Reflex Camera* will make an immediate appeal. It is corrected for parallax, and with Ikonflex 3-speed shutter in addition to T. and B., costs £6 10s. with f/6.3 Novar anastigmat, or £7 10s. with f/4.5. The "Super Ikonta," with its large-scale range-finder coupled to the focussing, at £17 with f/4.5 Zeiss Tessar, will appeal to those able to give expensive presents, as will,

of course, the "Contax," with f/3.5 Zeiss Tessar at £24 10s. Cheaper lines, but just as excellently made, are the Baby Box Tengor with f/11 Frontar lens at 18s. 6d., or with Novar f/6.3 anastigmat at £2 7s. 6d. Another popular line much in favour as a Christmas gift is the Superb Baby Ikonta Self-erecting Camera, at £3 7s. 6d. with f/6.3 anastigmat in Dervall shutter. A list of the numerous models available will be supplied on request.

DO NOT BE MISLED !

Even if you do not wish to project your films on a large size screen, it is essential that your machine should be fitted with powerful illumination or else under-exposed films will have to be scrapped.

THE NEW PAILLARD-BOLEX MODEL "D.A."

THE G916 BOLEX PROJECTOR

Specification.—2-in. f/1.6 Hugo-Meyer Projection lens, electric motor drive, with forward and reverse movements, all gear driven, "still" picture device, motor rewind, air-cooled lamphouse and mechanism, separate controls for lamp and motor, stainless steel pressure-plate and gate, simple masking device, ammeter, and variable resistance to lamphouse, direct lighting system. Very efficient outfit. Light and compact. Price, with 110-volt 400- or 500-watt lamp for use on A.C. or D.C. current. **£47:0:0**
Nine monthly payments of 109 8s. **£47:0:0**
Resistance for use on voltages 200 to 250 volts £2 10s.

The PATHÉSCOPE HOME MOVIE PROJECTOR 9.5-mm.

Gives a perfectly clear, brilliant and flickerless picture, 4 ft. x 3 ft., 12 ft. from the screen. Complete with mat, plug adapter and 12-volt lamp, for use on 110 volts. **£6:15:0**
Nine monthly payments of 15/9.

THE "WESTMINSTER" CINÉ TRIPOD

Rigid and sturdy metal legs of angular design, extreme rigidity in all positions, 3 sections, central section adjustable, giving a range of heights up to 50 inches. Each leg has a reversing foot, with spike or rubber buffer. Crown of tripod designed to prevent legs accidentally spreading. Head fitted with pan, and tilt movement controlled by handle which folds flat when not in use. Weight 3 1/2 lb., size 26 inches **£4:17:6**

The "OMBRUX" EXPOSURE METER

For still cameras **84/-**

The "BLENDUX"

For ciné cameras **84/-**

Nine monthly payments of 9/11.

December 12th, 1934

WITH the introduction of the new type of electric bulb, which works upon the principle that it is "overrun" to a considerable extent, a new power has been placed in the hands of the amateur photographer. During its short but brilliant life the bulb emits a light of high actinic value, and, used in conjunction with modern high-speed panchromatic plates and films, remarkably short exposures for portraiture can be given. Recently this type of illuminant has been further improved, and also reduced in price.

What the Lamp can do.

The photographer who has electric light available in the house, and adds one or more of these bulbs to his equipment, will find that his scope with regard to home photography on winter evenings is greatly increased. It is literally possible to take snapshots at night, provided that super-rapid plates or films are used, and the lens aperture is not less than $f/6.3$. The bulb can be attached to the ordinary electric light-socket at the end of a flex, and works from the usual house supply.

The life of one of these lamps is only a few hours continuous running, but obviously this is not likely to occur during the production of home portraits. The focussing and arrangement of the lighting can be undertaken with the light turned on, and will occupy a minute or two; the exposure is then a matter of a fraction of a second. In this way a bulb may last for a very long time, even years if only used occasionally; so that although they are more expensive than the ordinary electric light bulb in the first instance, they are cheap for the purpose for which they are intended. They are sold with the correct fittings which protect the house fuses, so that there is no danger attached to their use.

Portrait work always exercises fascination for the amateur photographer, but except under very favourable conditions the lighting is difficult to handle. Photoflood bulbs give the photographer an abundance of light, while it is not trying to the eyes, and is under the photographer's control, so that any effect required may be produced.

The light is intense when first switched on, but the sitter speedily becomes accustomed to it, and there is not the strained look in the eyes that might be expected.

Any other lights in the room may be left on; there will be little effect from them in the short time of exposure.

How to use.

The best position for the light, when only one is in use, is from the

Real Home Portraiture with the PHOTOFLOOD LAMP

A seasonable article for the amateur photographer

By R. M. FANSTONE.

Just a Sample.

Settling that Santa Claus business.

front, and a little to one side. This will ensure a pleasing modelling on the face. The light should not be too high; the best place for a head-and-shoulder portrait is about six or eight feet from the sitter, and about two feet above the eyes.

The light should be so arranged that its full effect is gradually brought on the face. The light should not be too near, under the impression that the exposure will be reduced; a more distant position will ensure a pleasing softness, and the effect will be more even. If the light is brought nearer the effect will be like that of a spotlight. The bulb should be used in a reflector. This helps to spread the light and protect it from impinging on the lens.

The lamp can be, if necessary, held in the hand in a holder in the same way that a flashlight is held, and moved about just as easily. Held at arm's length in this way the exact effect of the light can be judged to a nicety. It can, however, be used equally well on a light stand or tripod, and this, of course, becomes necessary if two bulbs are used.

Exposures.

Exposures range from $1/10$ th of a second at $f/6.3$ upon a soft-gradation panchromatic plate, to $1/25$ th of a second upon hyper-sensitive panchromatic roll film at $f/2.9$ (exposed in a miniature camera). Using indirect light reflected from a light wall, I have secured fully-exposed negatives at $1/10$ th of a second with the same film and apparatus. If two bulbs are used, one can be placed at a greater distance from the sitter to lighten the shadows and the exposure can be still further reduced.

If only one bulb is available, and this is usually sufficient for the amount of light that is given, a white reflector is sometimes useful for lightening the shadow side of the subject. If the portrait is taken in a room with light walls the same effect is achieved. In any case, the same care should be taken that is observed with flashlight photography, to avoid reflecting surfaces of pictures, mirrors, etc., which may reflect light back to the lens.

When developing, care should be taken not to carry the operation too far. This is a common fault, and will result in harshness that is very objectionable in portrait work. Tank development is the ideal for all panchromatic material, and for these subjects the normal time should be reduced by one-third. This will ensure that negatives are of the soft type, full of delicate gradation.

Fig. 1.—Portrait type. The name is not absolutely necessary if the faces are readily recognisable. The fire in this picture was tinfoil and photoflood lamp hidden by child.

THE popularity of the Christmas card shows no signs of abatement, and each year sees more made by photographic means. This is understandable, as the number of amateur photographers is steadily increasing, and a home-made greeting card bears something of the personality of the sender. It represents one's own handiwork, and as such is generally more appreciated than a mass-produced "bought" card.

Photography offers to the amateur

a variety of alternatives for the production of these cards; a few are suggested here. The biggest problem is that of subject. The following are the most possible for the amateur: (1) Portraits; these should be informal, of the family, the baby or children. (2) The home; some easily recognisable part, interior or exterior. (3) Winter scenes, etc. (4) Hobbies; any hobby or interest of the sender, whether appropriate to Christmas or not. (5) Table-top and still life. (6) Designs; preferably in black-and-white line.

There are two classes of photographic greeting cards: one in which a

print is made from a suitable negative and then mounted on an appropriate mount with the greeting and other wording written or drawn. The other—which may involve the use of two negatives and masks, and is entirely photographic—both subject and wording being from a negative, and printed on a larger piece of stout bromide paper which itself forms the mount and card.

The former is the more simple method, and is to be recommended to the average amateur; if necessary,

Fig. 2.—Home or Scenic type. Any view of the home or scene appropriate to Christmas, etc. The greeting in this card was added by attaching in contact to the original negative a very thin copy negative of the message.

Photographic

By

JOHN W. McFARLANE.

the greeting can be incorporated in the original subject if taken specially, as in Fig. 1.

Figs. 2 and 3 are a trifle more complicated, but represent a type worth doing. In this case the negative should be of a subject with a fairly large light area. The message is drawn in the centre of a large white card, and a thin copy negative made of a suitable size. In this the letters are quite clear and the background light grey, and it should, if possible, be on film. This is attached in contact with the picture negative so that the message is properly placed and the print or enlargement made from the two together.

Fig. 4 is another type in which a design complete with lettering is prepared and then photographed. In

The above diagram shows a few variations of folded cards. The simplest is A. A larger card with an extra fold is shown at B. C is made of two cards held together with a silk cord. D has a narrow turn-over only. E has an inner folder on thinner paper. F is folded twice. X represents appropriate positions for the prints.

Christmas Cards

this case a slow or "process" plate is used to obtain the maximum black-and-white contrast. (If necessary one plate can be used for the design and another for the lettering.) The print is then made on a large piece of bromide or gaslight paper, and when finished and trimmed is folded to make the finished card.

Fig. 5 is a typical table-top subject which offers endless possibilities with toys and dolls. In any case, the best possible technical quality in both negative and print should be striven for, and the finished result should be clean and neatly trimmed.

The finishing and mounting are

Fig. 5.—Table-top type. Table-top pictures are simple to make, and very effective. In this set the rabbits are saltcellars, the tree is a teasel, and its tub is a walnut shell, the mat represents the remains of one of the author's ties. Illumination is from three ordinary electric lamps, behind the wall, above and to each side of the fireplace; the back of the fireplace stood apart from the front to emit the light.

Fig. 3.—Hobby type. Any hobby, or even the profession of the sender. The message in this card was carried out in the same manner as in Fig. 2.

quite important. Embossing, sometimes called plate-sinking, greatly adds to the effect. If fifty cards or less are concerned, the simplest method is the use of a piece of double-weight paper of the same size as the desired embossed border, cemented to a sheet of glass and illuminated from below. The card to be embossed is then put face down over this piece and centred. If no embossing tool is at hand, a tooth-brush sawn off and rounded, or, in fact, any smooth, blunt rounded object may be used. The operation is shown in Fig. 6A.

Merry Christmas
and
Smooth Sailing
for the
New Year

Fig. 4.—Design type. Any drawn or painted design of any impersonal subject. The greeting should be related to the design, as in this case.

If a great number of cards are to be embossed, it will pay to make a cardboard press, as shown in Fig. 6B. The parts shown as shaded of this press are made from one of the Christmas cards themselves by cutting along a line where embossing is desired. This line should not be closer to the picture than a quarter of an inch. The centre part should have about $1/32$ nd of an inch trimmed from each side. A card to be embossed is placed in the press against a margin guide and the press run through a wringer. In the absence of a wringer, force may be applied on the top of the press, rubbing around the embossing line with the butt end of a screwdriver or even a spoon.

BACKHOUSE

How I make my EXHIBITION PICTURES

Methods and Ideals of well-known Pictorial Workers.

From information communicated to our Special Representative.

ALTHOUGH I was for many years sufficiently interested in photography to submit an occasional print to 'The A.P.' for criticism, it was not until six years ago that it became my premier hobby. My favourite cameras are $3\frac{1}{2} \times 2\frac{1}{2}$; one a T.-P. reflex with a 5-in. and a 10-in. (telephoto) lens; and the other a double-extension Zeiss Ikon 'Maxima,' with 'Distar' attachment.

"Week-ends are spent in the countryside and village street in search of the elusive masterpiece. It is really photographs of the atmospheric and weather conditions that make the best pictures; and if, after a long day, I have not made an exposure, I do not mind. If the game was too easy it would not be appreciated. Then there is the pleasure of the open air, and many things have been seen that would have been missed but for the urge of photography.

"Despite the weight, it is usually the reflex that accompanies me on these occasions, chiefly for the advantage of the 10-in. lens, which I think gives a more natural perspective for most outdoor subjects. It is especially suited to valley scenes taken from a high viewpoint, against the morning or evening light—a type of which I am particularly fond. Whenever possible the exposure is made on a rigid tripod.

"A camera is my companion every week-end and holiday throughout the year, and, during the lighter months, on my journey to and from business. The best picture often presents itself in unexpected places and during the roughest weather.

"I also attempt home portraiture, mostly of children, by means of a flash or half-watt lighting. In making the picture 'Christmas Eve,' the camera was located almost at ceiling level to give prominence to the child. Two flashes were used, the larger one being concentrated on the child by means of a tin cylinder in which the flashpowder was placed; the other and much smaller flash was near the camera, to give a stealthy light effect to the room. The two flashes were simultaneously electrically fired by means of a distant control device.

"I favour the backed soft-gradation panchromatic plate, with panchromatic roll films and film packs for extras. A filter is used or not, according to conditions. The time and temperature method of development is used, and developer mixed to maker's formula. My type of negative for a condenser enlarger requires about three-quarters the time given in the tables, and this time is again varied to suit the type of subject. Contrasty subjects and flashlight exposures are developed in Azol or Rytol.

"For many years I was a lone worker, deriving most of my tuition from the pages of 'The A.P.', and the criticisms of my prints entered for its Intermediate and Advanced monthly competitions. It was not until I joined the Leeds Camera Club in 1930, and had studied the methods of its leading workers, that I submitted pictures to open exhibitions.

"My prints are now made on 'Clorona' and Kodak 'Royal,' about 12×10 , and generally on a cream base. I have no objection to undetectable control, but my modifications are chiefly restricted to a little crayon and stump or some oil reinforcement. Bromoil I yet hope to master. My attempts as yet have fallen short of my bromide work.

"I take an interest in Press competitions, especially those stipulating the subjects. Some of these competitions encourage a high standard of technique, as after-work on a glossy print is easily detected, and competition is very keen. Several exposures made for this purpose have yielded exhibition pictures."

PICTURES of the WEEK

Some Critical Comments on the Beginners' prints reproduced on the opposite page.

THERE are two things that strike one forcibly about No. 1 of the prints reproduced on the opposite page—"Columbus, Ohio," by A. M. Armstrong. The first is the very charming way in which the sunlight on the buildings has been rendered, and the second is the unrelieved depth of the tones of the archway and foreground.

Foreground and Distance.

It is recognised, of course, that the dark tones set off the brightness of the buildings, and an element of good solid black is almost essential. It need not, nevertheless, be entirely devoid of modulation, and the vista would be no less attractive and lose none of its force if the shadows of the foreground were more detailed.

The probability is that a measure of under-exposure is present. It cannot be definitely stated in the absence of the negative, but the only other likely factor that could cause a similar blackness in the darks is over-development of the negative, or the use of a paper of too-vigorous characteristics, of which the print affords no evidence. At all events, the result is that which might be expected to follow an exposure on the short side, and, apparently, the reason is attributable to an insufficient allowance being made for the nearness of such heavy darks.

As an indication of what ought to have been given it may be said that, if the exposure was adequate for the distance, as it does appear to be, what is required to bring out modulation in the shadows would be something like eight to twelve times that which was allowed.

It is possible that even so great an increase might be only barely enough, but, if more were given, there would probably be some loss in quality in the lighter portions, and the best that could be hoped for is in the nature of a compromise.

Opposing Claims.

Some adjustment, perhaps, could be made by limiting the contrasts of the negative by reducing the time of development, but this, again, is an expedient to which recourse is restricted. It, too, would have the effect of reducing the quality, to

some extent, for, while it would permit a greater degree of modulation to be shown in the darks, the more subtle gradations of the lights would be less distinctively displayed.

The opposing claims of lights against darks and of exposure and development seem to present a problem that is almost insoluble, and, in the end, the best rendering is likely to be afforded by a compromise.

With No. 2, "November," by J. V. Cooper, the case is different. The subject, perhaps, is a bit on the flattish side, but not a great deal, and, if a normal exposure were given, followed by the usual time of development, a print on the normal grade of paper, or one with a shade more vigour, should prove quite satisfactory.

It does not present the extremes of contrast which made No. 1 so difficult. No noticeable difference would be discernible between a print that came from a negative that had just sufficient exposure and one that had six or eight times as much, whereas, with No. 1, the distinction would be marked. In the first, the exposure must be nicely adjusted, but in No. 2, as long as it is enough, the precise degree is unimportant.

A Case for Discrimination.

The two prints give an idea of the sort of thing that is met with in practice, and an indication of when a measure of discrimination has to be exercised, as well as when the need for caution is not so pronounced.

In No. 5, "Trees in Winter," by Denis Crowley, the range of contrast is somewhat greater than in No. 2, mainly on account of the proximity of the trees to the viewer; but the difference is not much, and, if somewhere about four times the exposure that No. 2 had were given, the normal procedure could thereafter be adopted.

These two winter subjects provide an illustration of the fact that this particular season has its opportunities as well as the summer. Photography may be practised the whole year round, and, even at Christmastide, when most of us are thinking of other things, the landscape enthusiast will be able to find subjects if he looks for them, while others, who may prefer

to remain indoors, may find plenty of material in the festivities appropriate to the occasion.

Indoor and Outdoor.

It may not be probable that out of doors such effects of sunshine as are shown in No. 1 and in No. 6, "Low Tide," by A. Aubrey, can be secured; but, on the other hand, the suggestion of atmosphere, which is nicely conveyed in both Nos. 2 and 5, is often available.

"Low Tide," with its suggestion of summer sunshine is, nevertheless, most pleasing, particularly by reason of its contrast with the weather we are now experiencing. The two principal figures are well caught, and lend interest to a well-chosen subject; and, if the third is not so fortunately presented, chance may be more favourable on another occasion. A little more foreground, to enable the figures to sit more comfortably in the picture space, seems desirable.

In other respects, the scene makes up very well indeed, and while the form of the arrangement is equally good in No. 3, "Evening," by Dorothy Cathro, the print is rather inclined to flatness, and the sky, in its blankness, is devoid of any of the suggestion implied by the title.

Blankness and Tone.

Were a real evening sky, with its long streamers of horizontal clouds, incorporated, the probability is that the picture would live up to its title, and, if a suitable cloud negative is available, the experiment of printing-in might be tried.

In the case of No. 4, "Through the Arch," by V. Aiyar, the same criticism—regarding the sky—does not apply, for the full gradation of the clouds seems to be rendered in all their subtlety of tone. Inasmuch, the print is good; but it, too, could do with a little more vigour, such as a touch of sunshine would confer, and possibly, by deferring the exposure a little, something of the sort might have happened. In that event, the gain in pictorial attraction would be appreciable, and, though it might have meant the exercise of no little measure of patience, it would nevertheless be well worth while. "MENTOR."

OUR ILLUSTRATIONS

Some Notes on the Pictures reproduced in this issue.

MOST appropriate to the season of the year, and illustrative of the sort of thing that only presents itself at Christmas-time, is "THE WAITS," by MRS. B. RODNEY BRYANT. It presents a scene that is very characteristic of that most enjoyable time, and indicates a class of work that can be undertaken by anyone with but a little contrivance.

Studies at Night.

Either flashlight, the flash bulbs that have been now on the market for some little time, or artificial lighting may be employed as the illuminant. The first two are practi-

cally instantaneous, and permit of the subject being shown without visible movement; while the second, in view of the need for an appreciably long exposure, involves the co-operation of the sitters.

In all cases, it is a simple matter to arrange for the lighting to be under control, and under conditions such as these the creation of pleasing pictures should not prove difficult.

Grouping, as in this instance, calls for some consideration, and due regard should be paid to the claims of naturalism. It will very often be found that the figures, without any prompting, assume good formations, and, if so, full advantage should be taken of the opportunity as it occurs. How far the group in this case is spontaneous, and how far it has been inspired by judicious posing, history does not

relate; but the formation is good, if inclined towards symmetry, and there is no obvious nor objectionable feeling of pre-arranged posing.

On the contrary, there is quite an excellent impression of spontaneity, and each individual figure is free from any suggestion of camera-consciousness.

Frontal Lighting.

The point might be raised that there is a certain lack of modelling in the features. This is attributable to the fact that the lighting is in much the same direction as the line of sight; but a tendency of this nature is always present when a frontal lighting is employed, particularly when, as here, the source of light is low in origin. It is this that is responsible for the absence of the details of the features in the chief figure (1), but, now that the cause is known, a recurrence may be avoided by taking the obvious precautions.

However, the matter is not, by any means, of vital consequence, and the picture attains a decided success in view of its seasonable topicality. On the whole, it is exceedingly well done, and instinct with the spirit of Christmas.

Children's parties and dances, too, are a feature of the period, and very delightful little studies can be made with groups of the participants. Of this, "AT THE PARTY," by H. TOLCHER, provides an instance, the two figures being shown in fancy dress. It is a very attractive piece of work, and, though there is little doubt but that the two figures were deliberately posed, the fact does not seem to force itself upon the attention.

Their arrangement and placing is very well managed, the boy (1) assuming primary principle by reason of his stronger placing and the fact that he is shown in an upright position. The figure of the girl (2) is somewhat subordinate, being put rather nearer the margin and in a sitting pose, but, nevertheless, is sufficiently in the picture to claim an appropriate measure of attention.

Subject and Setting.

The composition, as far as the arrangement of the figures is concerned, is therefore quite satisfactory, but, having regard to the very light tones of the dresses, the great depth of tone

in the setting introduces a feeling of harshness that would be better avoided.

It is appreciated, of course, that these things cannot be always arranged as could be wished, and there may have been no other alternative. The surroundings, however, would be more suitable if they were only a shade or so darker than the average tone of the figures or represented by a medium grey. This arrangement might possibly be contrived if a similar subject is essayed in the future, but, apart from this, the subject is very well chosen and most engaging in its presentation of childish charm.

Technically, too, the work is excellent, the rendering of the texture

of the satin of the children's dresses being particularly well recorded, and the distinctions between the tones in light and those in shadow being also most faithfully distinguished. It is always a pleasure to see such a high level of craftsmanship, and, even if we are not all blessed with an artistic vision, we can at least manage to achieve a like standard of workmanship.

In fact, the technical side of the work can to-day be handled with more ease and success than ever before in the history of photography. What was formerly difficult, or even impossible, has now become comparatively easy, thanks to great improvements in lenses, in sensitive material, and in methods of lighting. Our range of work is greatly enlarged, and we can give full scope to our ideas and ambitions.

"MENTOR."

Silhouettes

By
J. W. SUGDEN.

MANY articles have appeared from time to time instructing the amateur photographer how to make silhouettes by photography, the usual method being to place the figure in profile against a white sheet stretched across the open doorway of a darkened room, and to make the exposure by means of a flashlight illuminating the other side of the sheet. The camera in this case is on the same side as the sitter, and sharply focussed with a small stop to produce the cleanest outline and an under-exposed black-and-white result.

The following method enables real cut-out black paper silhouettes to be obtained which can be utilised for Christmas and greeting cards.

It will be found a good way of utilising spoilt portrait prints, or, if necessary, portraits can be made deliberately for the purpose, in which case quite rough prints will serve;

paper and maketwoor three silhouettes with one cutting. Another alternative, as far as the result is concerned is

Fig. 1.—The original print.

Fig. 2.—The cut-out.

but it is essential that they must be in profile.

The following is the procedure: Take the rough, unmounted print, and with a pair of small sharp nail-scissors cut carefully round the outline, trimming

away anything that is unnecessary in the shape of chair-backs, untidy hair, etc., but at the same time produce a clean-cut outline, especially in regard to the neck and shoulders.

Fig. 1 is a typical print for the purpose. Fig. 2 is another and spoilt print from the same negative that has been cut out as suggested. The cut-out print is then placed on a piece of thin black paper (the black paper in which bromide and gaslight paper is wrapped is quite suitable). With a very hard, sharply-pointed pencil the outline is then traced or marked round on the black paper, being careful not to move the print in doing so. This pencil outline is then cut again with the scissors, and a perfect silhouette is obtained which can be appropriately mounted on white card as shown in Fig. 3.

An alternative method is to cut out the black paper at the same time that the photograph is cut, holding the two pieces together and cutting through both. If necessary, after a little proficiency has been acquired, it is quite possible to cut through two or three thicknesses of the black

Fig. 4.—The print.

Fig. 3.—The silhouette.

to cut the silhouette in white paper and mount it on a black card.

These silhouettes are, of course, not entirely photographic, although brought about by using a photographic basis, and as such produce definitely attractive results that for some reason are more appreciated than those produced entirely by photographic means.

No photographic skill is required, as any suitable print can be used, and the merest novice can make quite distinctive silhouettes. It is particularly useful for prints that are of no value for other purposes, an example of which is shown in Fig. 4. This was a failure as a photographic portrait. It was taken by flashlight and the sitter's eyes were closed, but the profile is sufficiently clear to make an excellent silhouette as shown in Fig. 5.

Fig. 5.—The silhouette.

Winter

By
H. Q. A. REEVES

skimming and swooping on the ice like a swallow, graceful and effortless. Perhaps most spectacular of all sports is ski-jumping, and a picture of the intrepid jumper in mid-air during the course of an

A Ski-er climbing, carrying camera, etc., in a ruck-sac.

SWITZERLAND in winter is a veritable paradise for the photographer. The Alpine scenery, beautiful at all times, is enhanced by its covering of sparkling white snow, and every visitor with a camera will, of course, take photographs of the Alpine sports. Skating, ski-ing, and hockey, etc., are in full swing on all sides and provide endless subjects for pictures.

The value of light and shade for the making of a picture is fully demonstrated by an analysis of the landscapes to be seen around us. A word of caution, however, is well needed with regard to the light in the shadows, if under-exposure is to be avoided. Even in the sunshine the light is very deceptive, and it is only on snaps of distant landscapes that stops of $f/11$ and $f/16$, coupled with $1/50$ th sec., can be used.

Many photographs are spoilt by their lack of contrast and shadows. The sun should be shining from the side of the picture, or even towards the camera, provided that a lens hood is used. The worst possible position for the source of light is behind the photographer, as this tends to make the picture look flat, and the shadow of the operator will probably protrude into the foreground.

There are so many photographs which must be taken to record the holiday, particularly of action subjects. The expert ski-er dashing down the slope, raising clouds of snow at each successive ski turn, offers splendid opportunities for a high-speed snap; or there is the champion skater

The Ski-Jumper.

eighty-metre leap is a treasure to be guarded carefully to show our friends at home.

In most cases when photographing high-speed winter sports a shutter speed of $1/250$ th sec. (usually the highest speed on a Compur shutter as fitted to the modern hand camera) is quite sufficient for excellent results, provided that the camera is swung at eye-level and that the most opportune moment is selected for snapping.

Beginners.

Sport and the Camera

Ice Hockey.

Always avoid taking snaps of objects moving rapidly across the camera; it is better to have them approaching or departing in an oblique line to or from the camera. For other winter sport subjects not in violent action a slower speed can be used. If you are not already proficient on skis it is well to learn how to get about easily on them as soon as possible. Only then

will the best places for good photographs be reached.

Equipment is a point which most of us like to settle before starting on a holiday. Though all cameras are suitable for

Watching the Skating at St. Moritz.

Ski Turns.

snow photography the folding roll-film direct-vision cameras are preferable, as owing to their compactness and light weight they will go easily into a ruck-sac and will not be unduly heavy when climbing.

A yellow filter and an "all-round" lens hood are two necessities of equipment. Films and film packs can be purchased almost anywhere in Switzerland, and the modern panchromatic film is ideal for the work.

Even if the camera is not fitted with a shutter giving high speeds, plenty of good subjects are available with a slow speed. Figures can be secured when stationary, or they can be posed

in the right setting for effective pictures. If a tripod is taken, fine Alpine landscapes can also be taken with short time exposures. In this case, a colour filter and slower panchromatic material can be used to secure the full range of tonal rendering.

The main thing is to take plenty of photographs and go for the original and experimental snaps. The shop in the village can develop the first roll, just to make sure.

Winter Sunshine.

School Theatricals by Flashlight

Some timely hints on a seasonable topic.

By GWYNETH PENNETHORNE.

THIS is the season for school plays, and the amateur photographer is pretty sure at some time to be asked to take a few groups. Even if the lighting of the hall or "gym" is good, exposures by this alone would of necessity last several seconds, and as many of the players are likely to be small children, flashlight is by far the best form of lighting to employ.

Flashpowder is simple to use, and no one should be deterred through ignorance from attempting to tackle such a job if asked.

One is usually advised to choose the night of the dress rehearsal for the work, but I strongly advise waiting until the night after the performance; the actors will be far less "edgy," once "the night" is over, and the stage manager (a most important person) will be able to give you his undivided attention and valuable help.

It is advisable to get this gentleman (or lady) to make out a list of the scenes to be taken beforehand. One can then calculate the total amount of powder needed. Nothing is more annoying than to reach the last and most important scene powderless.

As a rule, the chief difficulty the novice experiences is in deciding the amount of powder to use for each exposure. The tables given with most commercial flashpowders act as a guide, but one is generally safe in doubling the quantity recommended; more failures in flashlight photography being caused by under-exposure than any other cause.

The photographer will find that in at least one picture he will be expected to include the entire caste. This will necessitate the camera and flash being a considerable distance from the stage; and the amount of powder needed will be larger than for the pictures taken nearer the stage. Except for the finale it is best to persuade the players to combine in smaller groups; these compose better, and the individual actors are given more prominence. One can also compress groups perhaps rather more than the stage manager may altogether approve, thus obtaining larger figures.

Indian Maidens.

The Doctor's Visit.

Pooh-Bear and Piglet.

As a rough guide I have found that for groups of three or four players, taken from a distance of about eight feet, with a certain amount of auxiliary lighting, 25-30 grains of powder is ample, using the lens at $f/8$ and a plate or film of about 600 H. & D.; for groups of six to eight, at a distance of twelve feet, 40-50 grains will be needed; while over twelve feet, for really large groups, 60-80 grains will not be too much. There is little danger of over-exposure, and it is better to use plenty of powder than run the risk of wasting time, film, powder, and, most of all, a valuable opportunity.

If a flashlamp is not available the powder can be fired from the lid of a biscuit tin, and a second lid fixed at right angles to the first will serve as a reflector. The flash can be fired with touch-paper supplied with the powder, and the instructions which are given with powders such as Johnson's or Agfa should be followed carefully.

A pair of tall steps will make an excellent support for the powder-laden tin. They should be placed above the level of the camera and to one side of it. Note that no hangings or draperies are near the flash, or that the flash is not too near the ceiling, or it may get scorched.

It is usually possible and advisable to leave on the ordinary room lights, as well as the footlights—if any.

If touch-paper is used for firing the flash it is a good plan to use only half the length supplied and so cut down the waiting period.

Except for "singles" a very fast lens is not a great asset. One is generally obliged to group the figures in at least two planes, and a stop of $f/8$, and occasionally $f/11$ is needed to bring all the actors into focus.

As in large groups the individual faces will be distinctly small, sharp focussing is imperative, so that enlargements of several diameters may be made.

There is not much smoke from the modern powders, and if a window is opened for a few moments after each shot little trouble will be experienced on this score.

With the Beginners

Every week an article appears under this heading dealing with a topic of interest to the novice in photography. This week our contributor has allowed the festive season to get into his head, with the following result.

A MINIATURE CHRISTMAS.

By "The Walrus."

IT seems to me that one Christmas is very like another, only more so; just a mix-up of goodwill, strained waistbands, turkey, waits, colic, King Wenceslas, bills, fat heads, and all sorts of sorts. But for photographers, who are the only people who matter much—and not very much, either—this ought to be the first real miniature Christmas.

When it comes to photographic presents, some of us will have to hunt for them with a double-barrelled microscope, and then we shan't find them. In the good old days, as we sarcastically call them, it was no use hanging up stockings to hold the cameras and things we expected, and a sack on the bed-rail was not considered *comme il faut* (or whatever it is) in the best circles. So there was nothing for it but to invent pyjamas. (Fig. 089A.)

Fig. 089.

But now a half-pair of Worthwool's real artificial silk stockings will hold a camera, and scarcely show a bump on the outside. It is nothing like as well filled as I have observed such things to be at other and more interesting times. (Fig. 089B.)

Fig. ?

The same sort of thing is noticeable in the gentleman (shall we say?) who has paid (or owed?) a few cool hundreds for a miniature outfit with gadgets, and distributed them through his pockets. There is no sign of them. We may think we can detect a slight protuberance, but that is just as likely as not to be a pickled onion he

swallowed at breakfast. He is as slick and sleek as a sand-papered tailor's dummy. (Fig. X13.)

Please do not write to point out that it ought to be a tailor's sand-papered dummy. I know it ought. And if you are going to be smart you can wish yourself a happy Christmas, and save me the trouble.

And you!

It is quite on the cards, too, that this year miniature cameras will figure in the Christmas pudding instead of coin of the realm, and the lucky silver pigs that have to be retrieved by surgeons from your innards later on. And it is therefore on the cards that Aunt Sophronia (Fig. ?) will bite on the latest miniature camera under the impression that it is a sultana, and smash her denture. (Laughter and cheers.)

Fig. X13.

On the whole, there seems a prospect of quite a diverting festal season, with hitherto unheard-of possibilities, perhaps even including a slump in the prices of lemonade powder and hand-knitted tripe.

With the aid of a tiny camera, and a still tinier Smashalight lamp we shall be able to take hundreds of portraits of bright young things, of whom the one shown in Fig. A1 is the best specimen I could dig up in the time. She is unnaturally natural, compared with some of them. For example, she has painted eyebrows on the front elevation of her dome, instead of

Fig. A1.

behind the ears, where some of the very best people prefer them. (Fig. A1.)

* * *

There is no need to bother about panchromatic material

for this job. Never mind the ruddy lipstick. It looks bad and tastes worse. If the Cupid's bow comes out jet black, and is split asunder by dental tombstones, all the better. The bright young things are not Art Critics, whatever else they may be called. And I have heard them called some funny things, too.

* * *

The sub-sub-standard ciné merchant should have the time

of his life this Christmas. For the first time he can work by half-rushlight power, and should get in some hefty

stuff in dark corners and other places where they spoon. If he knows his job he should reap a rich harvest in the murk of the conservatory between the dances.

* * *

He may also feature a few friends and relations such as those chucked in as a free sample in Fig. F4.5. Some of these weird specimens have almost a human appearance, and a slow-motion picture of such expressions as they occasionally register is very much worth while. There is no objection whatever to pole-axing the specimens when done with. The main difficulty is in refraining from doing it first.

* * *

I want it to be distinctly understood that my own liking for miniature articles is definitely limited. It does not extend, for example, to turkeys or boxes of cigars. Quite the reverse. If you regard this as a broad hint you are welcome to do so, and to take it.

* * *

So far these remarks have been, I fear, rather too instructional and technical; perhaps too serious for the jovial occasion. By way of introducing a little personal interest I will wish you a particularly jolly and adventurous teeny-weeny miniature Christmas; and after that a voluptuously massive and splendificacious New Year.

Fig. F4.5.

How to make GHOST PHOTOGRAPHS

CONTRARY perhaps to the reader's expectations, this article does not propose to deal with the photography of one's ghostly ancestors or of those other nameless apparitions, headless ghouls and corpse-snatching fiends, which seem to infest the atmosphere during this festive season.

Since the correspondence columns of this journal have in the past given some considerable publicity to the very fascinating question of whether or not real spirits can manifest themselves upon a photographic plate, it is obvious that interest in the subject is not confined to the believer in Spiritualism, or to the journals which are published for the benefit of such.

Round about Christmas-time, however, one cannot be bothered to wait patiently for the witching hour when the "blood-curdling brag-gart" returns to the scene of his crime. In fact, quite excellent spirit photographs can be obtained without waiting for the assistance of anything so ethereal as a ghost.

To take photographs in which a "spirit" has a prominent position, the following procedure is usually adopted:

The person elected to "see" the apparition sits down in

the ordinary way with an appropriate expression of fright or astonishment fixed upon his or her face.

A straightforward flash-light photograph is then taken, using, however, only about four-fifths of the normal quantity of flashpowder.

The sitter retaining exactly the same pose, the "ghost," who is a second person suitably attired in light-colour clothing, then takes up his position, and the remaining one-fifth of the flashpowder is fired. If the two charges of powder are mixed and put out beforehand for rapid use, the making of the second exposure will be greatly facilitated. The camera must, of course, be on a tripod and not moved between the two exposures.

Care should be taken also to see that the background is not a plain one, since the transparent effect of the "ghost" is greatly enhanced when a few chairs and other articles are visible through its body. The ultimate result of the double exposure is, of course, obvious: the first yields a picture of the host, the second a picture of the ghost. The combined effect is most realistic, if one may be permitted to use such a term in reference to a "ghost" picture. GRIFF. J. JONES.

9 x 12 cm. for 6 plates... £1 5 0
for 12 plates... £1 10 0
Carriers for Cut Films or Film Packs. Doz., 12/-

'CORREX' ROLL FILM DEVELOPING TANK

The film is wound on a reel together with a separating apron, in a dark-room. Developing, fixing and washing can then be carried on in daylight.

No. 731. "Correx" Tank for V.P. size film. £1 5 0

No. 733. "Correx" Tank for 3 1/2 x 2 1/4 in. films. £1 10 0

No. 735 for 2 1/4 x 4 1/4 in. films. £1 10 0

"Correx" Thermometer. 2/6

"Correx" Developing Powders, per doz., 1/8

'JUSTODREM' EXPOSURE METER

The simplest extinction meter on the market.

The "Justodrem" will show the correct exposure at a glance. A table of Scheiner speeds is included with each instrument.

Price..... 15/-

Leather Case, 3/- extra.

THE 'WALLET' POCKET TRIPOD

This new de luxe quality pocket tripod folds flat when not in use and weighs only 14 oz. It is of light metal construction throughout. Length when closed 8 1/2 in., 46 in. high when fully extended. In flat leather case. 9 x 2 1/2 x 1 in. Price £1 10 0

THE 'RHACO' CAMERA HOLDER

A neat, portable accessory, fitted with camera screw, with nail and socket head. Can be attached to a fence, gate, tree, table or any other solid support.

Price..... 7/3

Soft Leather Case, extra 2/6

4,000 C.P. FLOODLIGHT REFLECTOR FOR AT HOME PORTRAITURE

The light given by a 500-watt Nitraphot lamp with this Floodlight Reflector is extraordinarily intense; yet it is soft and well diffused. Price..... 20/-

With 9-ft. flex with wall plug, also lamp-holder fittings.

Diffuser 2/6 extra. Metal Telescopic Tripod, extending to 70 in. high. 12/6.

500-watt Nitraphot Lamp, 20/-. Please state voltage when ordering.

'RHACO' DIRECT-VISION VIEWFINDER

When using the Rhaco Finder the camera can be held at eye-level.

With blue glass. 10/-
Leather Case 2/- extra.

State make of camera when ordering.

'PHOTOSKOP' ELECTRIC EXPOSURE METER

For 'Still' or 'Movie' Cameras.

The Photoskop is entirely automatic and in no way dependent on the human factor. Unlike other electric exposure meters, the Photoskop indicates the exposure directly without reference to tables and without any calculations. Price, including Leather Case, 25 6 0

SETS OF 'OPTOCHROM' LIGHT FILTERS FOR LEICA AND ROLLEIFLEX CAMERAS

These Filter Sets consist of Nos. 1 and 2 "Optochrom" Yellow Filters, "Optochrom" Green Filter and "Optochrom" Red Filter. To fit Rolleiflex cameras..... 22 5 0
To fit Leica cameras..... 22 10 0

THE 'TRIPOCANE' WALKING STICK TRIPOD

A complete telescopic tripod contained in a walking-stick. The tripod is light, yet remarkably rigid. In appearance the "TriPOCANE" cannot be distinguished from an ordinary cane. Price, with detachable handle..... 21 10 0
With swivel handle..... 21 15 0

Amateur Cinematography

NEWS, NOTES AND MATTERS OF INTEREST FOR ALL CINEMATOGRAPHERS USING AMATEUR CINÉ APPARATUS.

Yuletide Hints for the Cinematographer

By SIGURD MOIR.

ONCE again, the festive season promises to be a very busy one for the amateur cinematographer. Busy, for with Christmas Day itself falling upon a Tuesday, celebrations will in a great many cases be extended over a period of five full days, in which event the question of programmes is going to present a somewhat trying problem.

Apart from this, there is the precautionary amount of overhaul work to be done; and it is advisable, too, to take full advantage of the usual for-gathering of friends to make a comprehensive family film of the festive period.

Films.

Unfortunately, there are bad as well as good ways of carrying out these Christmas tasks, and all too often it is the bad ways that prevail. Oftentimes, for example, the hiring of films is left until the last moment (when it is difficult if not impossible to obtain any of the films that are considered suitable for inclusion in the many displays which have to be given).

Then the projector is apt to be put into use without first being subject to a thorough overhaul—which, together with cleaning, becomes an essential to success in any continued run of shows. Nor does this take into consideration the appreciable preliminaries to filming even a 400-ft. family reel.

For a beginning, then, steps should be taken to obtain all the films likely to be required over the period. This, even where a good accumulation of films is already possessed, is likely to prove a difficult matter unless recourse is had to outside assistance. And in this connection it is impossible to over-estimate the value of interchange facilities which already exist within the amateur movement.

Most clubs or societies which possess any organisation worthy of the name are able to put members in touch with one another for the purpose of conducting these exchanges, whilst in many cases facilities actually exist for the loaning out of films previously acquired by the club librarian. In addition to which amateurs can always approach one another with a view to exchanging personal films for the period of the vacation.

Quite apart from these facilities, recourse can in most cases be had to the extensive stocks of commercial libraries. But here a word or two of warning:

keen amateurs always place a reservation upon the films they want some few days before the actual time at which the films will be required for showing—and, despite the fact that in one or more cases as many as 400 copies of a single film are known to be in existence, it must therefore be regarded as essential to make early application for the best and most popular of library releases.

In most cases, too, it is advisable to have on hand a fairly extensive list of alternatives; not that librarians are wont to substitute any but the same type of films for those not in stock—but it is most distressing at this time of the year to show films that the majority of guests have already seen.

Projection Preliminaries.

If these selected films are to be seen at their best the projector (or projectors) must naturally be adjusted to give of their utmost efficiency. Frictional parts must be thoroughly cleaned and oiled,

and a running test made in order to regulate the drive at projection speed.

For cleansing, there is nothing more suitable than kerosene, which must be applied with a stick swab and then removed prior to lubricating the machine. Most manufacturers recommend a light oil (some, the lightest mineral oil obtainable) for lubrication, and this is generally very sound advice. In the case of gear-driven machines, however, it will be found better to use Wakefield's heavy oil for the larger bearings and crown wheel gears—especially on the Paillard G916 and similar robust projectors. (This oil is obtainable from most stores in sixpenny injector cans; the only possible objection to its general use is that in very cold weather it may be necessary to run the machine for a minute or two immediately before the show, in order to attain proper projection speed.)

The next important thing is to clean

There is always the possibility of snow at Christmas-time. In view of this the amateur cinematographer should be prepared to secure typical action subjects such as the above while the going is good and before a thaw sets in.

out the gate, after which it must be seen that the lamp is properly centred within the projector. This can be done by holding a positive lens (such as that in a simple reading-glass) directly in front of the projector objective and varying the distance until an image of the burning filaments can be seen on the screen. Any deviation from the central position can thus be corrected in the minimum of time.

In glaring cases, of course, the fault manifests itself in the form of coloured spectrum lines appearing on the sides of the screen.

A Film Record.

The holidays should certainly not be allowed to slip by without making at least one short film for future showing to family audiences; but unless the film is well made it is far better to leave the whole project alone.

Undoubtedly the essential requirements are super-sensitive panchromatic film, a camera well equipped with wide-aperture lenses and—if any long shots are to be attempted—a few brilliant lights. The half-speed intermittent may be found helpful, and good reflectors are almost indispensable. And always

remember that reversal film can sustain under-exposure where positive-negative would be ruined.

Space does not permit of our going any farther into technical details; but the need for avoiding film friction, and going directly for a "straight" but well-planned record film, cannot be too strongly stressed. Indeed, in this, as in most other things (Oscar Wilde notwithstanding), truth is easily more desirable than make-belief.

With this advice I wish you all a Merry Christmas and—Good Screening!

Christmas Presents for Cinematographers

By "ACTINOGRAPHER."

Yuletide gifts "from one cinematographer to another" are always selected with a view to useful service. The following article offers some assistance in this matter and also suggests a number of frequently-overlooked alternatives.

CHRISTMAS again! And of all the tasks that confront the amateur cinematographer one of the most important is that of selecting gifts and souvenirs for his closer acquaintances. Some of these will unaccountably prefer bad cigars and disconcerting ties; but not a few will wake up to find themselves richer by one or two ciné accessories or possibly a piece of major apparatus.

The presents can, indeed, be divided into two distinct classes; one for those who already possess the major equipment, and another for those relations (especially young nephews) who are tremendously interested in the hobby and who would certainly appreciate the gift of a brand new camera or projector. In the first case, one's outlay is not likely to prove so great; yet there is no little difficulty in making an appropriate selection from the great variety of presents available.

Perhaps the most acceptable of all such is the gift of a new feature film. These films range in size from one or two reels

to seven or eight—with certain subjects priced at slightly higher rates than others. Camera-men, however, occasionally look askance at commercial prints (!), and for these enthusiasts it may be more satisfactory on the whole to purchase a few spools of super panchromatic or similar raw stock.

Exposure meters vary very considerably in price, so it may not be difficult to comply with veiled requests for "a meter"—and much the same applies to filter sets. Tripods, however, are in a different category. In order to be efficient, they must be able to support the weight of a heavy camera, and to remain rigid under the strain of vibrations created by a robust motor; for these reasons only the best is good enough in tripods.

For those who already possess a good collection of feature films, few presents will prove more acceptable than one of the new hide-and-velvet carrying-cases. These are obtainable in a variety of prices and sizes, each reel having a separate compartment to itself, so that

it may be advisable to ascertain the size of the recipient's favourite subject and to specify when ordering the number of compartments required (including, of course, one for the take-up). Carrying-cases are also obtainable for a number of projectors which are ordinarily sold without any other protection than that offered by the manufacturer's supply box.

Both projectionists and producing amateurs also like to possess enlargements from their favourite frames; and for all such the great attractions of a ciné-film enlarger should not be overlooked. Accessories to complete these attachments include a film pack, packet of contact printing paper and an ordinary printing-frame.

Amongst a host of smaller presents, such things as splicers, spare lamps and humidors can definitely stand out. The latter especially (each includes an empty 450-ft. reel) is always more welcome than the alternative tragic tie—for there is no limit to the number of such cans that the active amateur can put into use.

and cigarettes. Readers who have likely series for disposal should get in communication with this firm.

NEWS AND REVIEWS

ITEMS OF GENERAL INTEREST FROM ALL QUARTERS.

The Northern Photographic Exhibition organised by the Manchester Amateur Photographic Society and the Bradford Photographic Society was opened in the Manchester City Art Gallery on December 8th, and will continue until January 19th, 1935. Over 2,000 prints and nearly 1,000 transparencies were received. This constitutes a record for the "Northern." Apart from the British Isles, entries were sent from eighteen countries—but owing to the limited space available only 440 prints are shown, about one-fifth of the number submitted, and 270 slides. The exhibition is of a very high standard and is regarded as one of the best seen in Manchester.

The Nottingham and Notts Photographic Society has recently changed its Hon. Secretary, the position now being held by Mr. H. C. Fletcher, 323, Hucknall Road, Nottingham.

Users of the Ensign "Midget" Camera will be pleased to know that they can now obtain Selo fine-grain panchromatic film suitably spooled for this popular little camera. It is supplied in six-exposure spools at 9d.

Photographs Wanted. Messrs. R. & E. Boyd, Ltd., of 130, New North Road, N.1., are in want of photographs of places of interest in this country to issue as a series of picture cards for tobacco

A complete 9-mm. ciné film library has been started by Wallace Heaton, Ltd., of 119, New Bond Street, W.1., and has been arranged to include all the films in Messrs. Pathé's Continuous Title Library. They will be available for release for the first time for the Christmas holidays, and thus ensure that those who book early will get absolutely brand new copies for showing on this occasion. Catalogue and full particulars should be applied for at once by all readers who are interested in 9-mm. films.

An Exhibition of American Pictorial Photography is now open at the Royal Photographic Society's House, 35, Russell Square, W.C.1. It will remain open to the public until December 31st. Admission is free.

The Week's Meetings

Societies will have their meetings announced here if the syllabus is sent to us at the beginning of the session or from time to time.

Exhibitions and Competitions

CURRENT AND FUTURE.

The Amateur Photographer Monthly Competitions for Beginners, Intermediate and Advanced Workers.—Entries, December 31. Rules in the issue of November 28.

Chicago International Salon.—Open, December 13-January 20. Chicago Camera Club, 137, N. Wabash Avenue, Chicago, Ill., U.S.A.

"Northern" Exhibition, City Art Gallery, Manchester.—Open, December 8-January 19. Secretary, J. Chapman, 25, Radstock Road, Stretford, Manchester.

Western International Salon.—Open, December 10-15. Organising Secretary, W. H. Hill-Muchamore, 24, Church Road, Redfield, Bristol, 5.

8th International Christmas Salon of Photography, Antwerp, 1934-35.—Open, December 23, 1934-January 7, 1935. Particulars from Mr. J. Van Dyck, Secretary of the Fotografische Kring "Iris," Ballaerstr., 69, Antwerp, Belgium.

Madrid International Salon.—Secretary, Sociedad Fotografica de Madrid, Calle del Principe, 16, Madrid, Spain.

Preston Scientific Society (Photographic Section). Open Exhibition.—Entry forms due, January 11; exhibits, January 17; open, January 28-February 16. Secretary, F. Wells, 65, Powis Road, Ashton, Preston, Lancs.

International Miniature Camera Exhibition, for

prints and enlargements made from miniature camera negatives.—February 1-21, 1935. Latest date for entries, January 21. Entry forms and particulars from Exhibition Secretary, British Photographic Fellowship, 7, Aberdeen Mansions, Kenton Street, W.C.1.

South London P.S. Annual Exhibition.—Entries, January 22; open, February 16-March 16. Details and entry forms from Hon. Exhibition Secretary, H. S. Adams, 40, Stockwell Park Road, S.W.9.

Leicester and Leicestershire Photographic Society International Exhibition.—Open, February 25-March 2, inclusive. Particulars and entry forms from the Hon. Organising Secretary, W. N. Plant, 30, Harrow Road, Leicester.

Ilford P.S. Annual Exhibition.—Entries, February 2; open, March 4-9. Hon. Exhibition Secretary, H. G. Haylock, 58, Windermere Gardens, Redbridge Lane, Ilford, Essex.

Birmingham P.S. Annual Exhibition.—Entry forms due, February 9; exhibits, February 12; open, March 2-16. Secretary, E. H. Bellamy, Waterloo House, 20, Waterloo Street, Birmingham.

City of London and Cripplegate P.S. Annual Exhibition.—Closing date, February 11; open, March 11-16. Exhibition Secretary, J. R. P. Hilliard, 86, Downton Avenue, Streatham Hill, S.W.2.

L.M.S. Annual Exhibition.—Entries, February 13; open, March 11-16.—Secretary, A. J. Scrivener, Station Master's Office, Euston Station, N.W.1.

Cannes Photo-Club International Salon.—Entries, February 20; open, March 31-April 7. Entry forms from Secretary, Photo-Club of Cannes, Boite Postale 105, Cannes, France.

G.E. Mechanics Institute P.S. Annual Exhibition.—Entry forms due, February 22; exhibits, March 1; open, March 12-13. Hon. Exhibition Secretary, W. F. Calcraft, 76, Gurney Road, Stratford, E.15.

Barry C.C. International Salon.—Entries, March 8; open, March 18-23. Secretary, J. H. White, Caerleon, 61, Pontypridd Road, Barry, Glam.

Scottish National Salon (Art Galleries, Ayr).—Entries, Overseas, March 9; Great Britain, March 23; open, April 20-May 4. Secretary, Arthur J. Nelson, 6, Hilary Crescent, Ayr, Scotland.

Brussels International Salon.—Entries, March 15; open, May 7-June 9. Secretary, M. Maurice Broquet, Rue du Sceptre, 77, Brussels, Belgium.

Antwerp International Salon.—Entries, March 15; open, April 27-May 12. Secretary, D. J. de Groot, Van Heystrelt-Straat, 19, Deurne-Antwerp, Belgium.

Hackney P.S. Annual Exhibition.—Entries, March 25; open, March 27-30. Secretary, Walter Selfe, 24, Pembury Road, Clapton, E.5.

Readers' Questions ANSWERED

GENERAL.—All communications for the Editor should be addressed: "The Editor, *The Amateur Photographer and Cinematographer*, Dorset House, Stamford Street, London, S.E.1," and in every case, without exception, must give the name and address of the writer.

CONTRIBUTIONS.—The Editor is glad to consider original, up-to-date manuscripts on photographic subjects. All contributions must be typewritten, or in very legible handwriting on one side of the paper only. Letters or communications arising out of matters already appearing in the paper are not paid for. The Editor disclaims legal responsibility for the safety of matter submitted to him, but he will endeavour to return rejected manuscripts, etc., when a stamped addressed envelope is enclosed. MSS. or prints that are not actually accompanied by a stamped wrapper or envelope can in no case be returned. Reproduction fees for prints are only paid by arrangement beforehand. The sending of a print, without any condition stated, will be taken as permission to reproduce it without fee.

ENQUIRIES AND CRITICISM.—Advice, Criticism and Information are freely given, but the following conditions should be read carefully before applying, as any communication which does not comply with the rules must be ignored.

(1) See "General" above. (2) Every question and every print for criticism must be sent separately through the post, and must be accompanied by a separate stamped addressed envelope. No exception can be made in any case to this rule, except so far as enquiries or prints from Overseas are concerned. (3) Neither enquiries nor prints for criticism must be enclosed with competition prints. (4) On the back of each print sent for criticism, in addition to the name and address of the sender, must be the title (if any), and the criticism coupon from the current issue. (5) Enquiries should be clearly written, on one side of the paper only, and should be specific and not general. Such enquiries as "How can I take interiors?" or "Can you give me some hints on outdoor portraiture?" are too general to be dealt with in this section. (6) All envelopes should be distinctly marked "Query" or "Criticism," as the case may be. (7) Prints are sent for advice or criticism on the distinct understanding that by so doing permission is given for their reproduction without fee. We endeavour to deal promptly with enquiries, but cannot undertake to answer by return of post, nor can we give precedence to any enquiry.

A selection of those replies is printed each week, but all questions are answered by post. Enquiries from abroad must contain a coupon also, but it need not be from the current number, and should be cut from the latest issue to reach the enquirer.

Single Components.

Can I use the front or back combination of my lens alone? If so, will it be an anastigmat?
R. C. H. (Scunthorpe.)

We cannot say how the single components of your lens will work, but, in any case, they will not be anastigmats, but what are known as "single" lenses. If you have sufficient camera extension you may find the single components useful for landscape, and even portrait work, but the quality of their performance can only be decided by actual trial.

Choice of Enlarger.

I cannot decide whether to have a condenser in an enlarger or not. A catalogue I have says "Condenser enlargers are fast becoming obsolete," and yet condenser enlargers are still being made. Which type of enlarger do you advise?
E. V. M. (Illey.)

With very small negatives there is no difficulty in getting even illumination without a condenser, although the exposures are necessarily longer. The statement that condensers are becoming obsolete is not accurate, except in the case of very small negatives, and even then there is something to be said against the assertion. Many have a preference for a condenser, but using diffused instead of direct light.

Tinting Photographs.

I have been trying to tint glossy bromide prints, but even when they are wetted first the colours are streaky. What can I do to avoid this?
N. W. (London.)

We know of no reliable means of doing away with this trouble entirely, although the use of a little ox-gall in the water helps. Personally, we prefer a matt surface, which is less repellent than a glossy one, and in our opinion looks better when finished. Soak the print first, lay it on a sheet of glass, surface-dry it, and apply the colours in a series of light tints at intervals rather than in one strong one.

Developer Stains.

I developed several negatives with some old developer (single solution), and they are stained and dirty. Can anything be done to make them usable?
D. O. M. (Exeter.)

You do not give much information to guide us. We suggest the following treatment. Immerse the negative for ten minutes in:

| | |
|------------------------|---------|
| Potassium permanganate | 25 grs. |
| Common salt | 1 oz. |
| Glacial acetic acid | 1 oz. |
| Water | 10 oz. |

Keep the dish moving during the operation. Rinse negative. Place till bleached in 10 oz. water containing ½ oz. potassium metabisulphite. Rinse. Re-develop in fresh solution (such as M.Q., amidol, etc.), wash and dry.

Distortion.

What is about the shortest focus lens that can be used for portraits without showing distortion?
A. L. (London.)

Your question indicates that you are under a misapprehension. What you evidently mean by distortion is not a question of focal length, but of distance from lens to subject. It is best not to have the lens nearer to the face of the sitter than nine or ten feet. Whatever the distance the only difference made by focal length will be one of size, not of drawing.

Pyro for Tank.

If it is possible to use pyro for tank development, will you suggest a formula?
H. W. (Birmingham.)

It is quite possible, and here is a suitable formula:

| | |
|---------------------|----------|
| A. Pyro | 280 grs. |
| Sodium sulphite | 4 oz. |
| Pot. metabisulphite | 210 grs. |
| Water to | 20 oz. |
| B. Sodium carbonate | 4 oz. |
| Water to | 20 oz. |

The tank solution is A, 1 part; B, 1 part; water, 18 parts.

Formalin.

Can you give me a hint or two on how to prepare and use formalin? What is it, anyhow?
C. J. (Salford.)

To answer your second question first, commercial formalin is water containing forty per cent of the gaseous aldehyde of methylic alcohol. In photography it is used for hardening the gelatine coating of prints and negatives, and is so effective that even boiling water will not melt the hardened gelatine. If one part of the commercial solution is added to nine or ten parts of water, prints and negatives will be hardened in three or four minutes; a solution of one in twenty should be allowed to act for ten minutes. Subsequent washing is not necessary, as the gas disappears as the water dries out.

Gum-Bichromate.

Where can I get a book about printing by the gum-bichromate process? Are materials for it obtainable commercially?
M. L. W. (Bolton.)

We know of no book now in print that deals with this process only, but you will find all the necessary information in "The Dictionary of Photography," where nearly a dozen pages are devoted to it. Many years ago prepared papers were obtainable commercially; but all the best-known exponents of the process prepared their own. The scope for individuality of method thus afforded was one of the few advantages of the process.

Testing Shutter.

I understand there is a laboratory in or near London where shutters are accurately tested. Can you give me the address?
C. C. M. C. A. (Glasgow.)

The National Physical Laboratory, Teddington, Middlesex.

Ink Stains.

How can I remove ink stains from a negative?
A. M. S. (Devizes.)

Several methods have been suggested for removing ink stains from prints, and these apply also to negatives. At the same time, we hesitate to recommend any of them for two reasons. First, because their success depends largely on the character of the ink, and, secondly, because any treatment which will remove the ink may also damage the image.

Chromium Stain.

What is the strength of metabisulphite solution for removing chromate stain in intensification?
L. A. L. (London.)

The exact strength of the potassium metabisulphite solution is not important, but five per cent is generally regarded as suitable.

Composite Pictures.

Is there a book dealing specially with the building up of composite pictures from different negatives?
H. E. H. (London.)

We cannot recall any book devoted to detailed particulars as to making composite pictures, although the matter is dealt with incidentally in various textbooks, and in many articles. There are so many methods and so many personal ideas on this subject that the information has to be picked up from time to time from all sorts of sources.

XMAS FARE AT THE SERVICE COMPANY

THE 'DEKKO'

For 9.5-mm. Films.

Hand-driven. Body and lamphouse of stout cast metal. Built-in resistance, 110 to 250 volts. Complete with carrying-case.

£3 : 10 : 0

Or 6 equal payments of 12/6 per month.

DEKKO—for 9.5-mm. Film

Single Pictures and Variable

Speeds—8 to 32 Frames.

With f/3.5 Dallmeyer lens

£6 6 0

Or 12 equal payments 11/- per

month.

With f/3.5 Cooke lens £7 17 6

Or 12 equal payments 13/9 per

month.

With f/1.9 Ross lens. £9 18 6

Or 12 equal payments 17/4 per

month.

Telephoto 3 in. f/4 Dallmeyer.

£5 5 0 extra.

ENSIGN MIDGET MAGNAPRINT

For Leica and 3x4 cm. negatives, f/6.3 anastigmat lens, condenser, 15x12 in. baseboard, electric light.

PRICE £4 : 10 : 0

Or 9 equal payments of 10/7

per month.

Leica Carrier.....10s. 6d.

100-watt Silvalux Lamp,

3s. 6d.

3½ x 2½ Magnaprint, as above

£7 10 0

Or 12 equal payments of

12/11 per month.

THE 'LILLIPUT' MIDGET TRIPOD

7 in. closed, 45 in. open.

Weight, 10 oz. In stout

duraluminum. Spring catches.

PRICE 21/-

BAROMETER FOR DESK, TABLE or BOUDOIR.

Chromium Plated.

Fine quality movement.

Extremely smart and modern.

No. 56. 4 in. square

PRICE 18s. 0d.

No. 57. 5 in. square

PRICE 19s. 0d.

'OMBRUX' METER

For all "still" photography. Gives direct readings under practically all lighting conditions

£4 : 4 : 0

'BLENDUX'

For ciné work **£4 : 4 : 0**

12 payments of 7/6 per month.

SPECIAL XMAS BARGAIN

TEN ONLY, USED

IN FINE CONDITION

BABY PATHE

Double-claw 9.5-mm. Projectors.

Hand-turn, complete with 100-250 volt resistance. Usual price

£7 5s.

OUR

PRICE £4 : 10 : 0

Or without resistance, **£4 : 4 : 0**

"Service" Silver Screen,

32 in. by 24 in. . . . 7/6

9.5-mm. ALEF JUNIOR PROJECTOR

HAND TURNED, for 30 or 60 ft. reels.

Stoutly constructed, 40 watt lamp giving a brilliant picture.

No resistance required.

Price

£1 : 7 : 6

State voltage when ordering.

Spare Lamps 4/6 extra

BOLEX 'D.A.' PROJECTOR

For 9.5 and 16 mm.

Motor driven, fan cooling, 250-watt lamp, Hugo-Meyer lens.

A guaranteed outfit.

£36 : 0 : 0

Or 12 equal payments of £3 3s. 0d. per month.

REELS & HUMICANS

For 300 ft. or 400 ft. 9.5 mm., **3/6** per pair.

For 16 mm., 400 ft. **4/-** per pair.

Post 6d. extra.

'SERVICE SUPERB'

3½ x 2½, double extension, f/2.9 Meyer Trioplan, delayed Compur shutter, 3 slides

£9:17:6

Or 12 equal payments of 17/3 per month.

With f/3.5 Zeranar lens, Compur shutter

£6:15:0

Or 12 equal payments of 12/3 per month.

THE 'SERVICE GEM'

16 exposures on 3½ x 2½

F/2.9 Steinheil Cas-sar, delayed Compur shutter, direct optical finder, camera body of stout bakelite.

£5 : 19 : 6

Or 12 equal payments of 10/6 per month.

Leather ever-ready case . . . 12/6

'SERVICE' METAL TRIPODS

IN STOUT BRASS.

4 section, 48 in. high . . . 5/6

5 " 50 " " . . . 7/-

7 " 52 " " . . . 8/9

Post 9d. extra.

Ball and Socket, 3/9 extra.

Phone : Holborn 0664 (3 lines).

Established 1889.

289, HIGH HOLBORN, LONDON, W.C.1

'PHOTOSKOP'

For "still" or "ciné" cameras, The Photoskop gives a direct reading without reference to tables.

£5 : 5 : 0

12 payments of 9/2 per month.

THE BALDA Distance Meter

Simple, quick and efficient in recording distances from 2 ft. to infinity. Fits horizontally on the side of camera, base clip supplied, all in purse.

£1 : 10 : 0

Half actual size.

Business Notices

Publishing

OFFICES.—Dorset House, Stamford Street, London, S.E.1. Telegrams: "Amaphot, Watloo, London." Telephone: Hop 3333 (50 lines).
PUBLISHING DATE.—"The Amateur Photographer and Cinematographer" is on sale throughout the United Kingdom every Wednesday morning.
SUBSCRIPTION RATES.—British Isles 17/4 per annum, Canada 17/4, other countries abroad 19/6 per annum, post free.
REMITTANCES.—Cheques, etc., should be crossed and made payable to Iliffe and Sons Ltd.

Displayed Advertisements

Communications on Advertisement matters should be addressed: The Advertisement Manager, "The Amateur Photographer and Cinematographer," Dorset House, Stamford Street, London, S.E.1. Copy for displayed advertisements for the issue of any particular week must reach Dorset House by the first post on Tuesday morning in the week previous. Rates and conditions will be sent upon application.

Prepaid Advertisements

SALE AND EXCHANGE: AMATEURS ONLY—
 12 words or less 1/-
 1d. for every additional word.
PROFESSIONAL AND TRADE:—
 12 words or less 2/6
 2d. for every additional word.

Each paragraph is charged separately

SERIES DISCOUNTS are allowed to Trade Advertisers as follows on orders for consecutive insertions, provided a contract is placed in advance, and in the absence of fresh instructions the entire "copy" is repeated from the previous issue: 13 consecutive insertions, 5%; 26 consecutive, 10%; 52 consecutive, 15%.

All advertisements inserted in these columns must be strictly prepaid and posted to arrive at the Head Office, Dorset House, Stamford Street, S.E.1, not later than first post FRIDAY for the following week's issue, or one day earlier at the Branch Offices, 19, Hertford Street, Coventry; Guildhall Buildings, Navigation Street, Birmingham, 2; 260, Deansgate, Manchester, 2; 25a, Renfield Street, Glasgow, C.2.

Advertisements are inserted, as far as possible, in the order received, and those received too late for one issue, or crowded out, are published in the first following in which there is space. The Proprietors retain the right to refuse or withdraw advertisements at their discretion.

Postal Orders sent in payment for Advertisements should be made payable to ILIFFE AND SONS LTD., and crossed

& Co.

Notes being untraceable if lost in transit should not be sent as remittances.

The Proprietors are not responsible for clerical or printer's errors, although every care is taken to avoid mistakes.

BOX NUMBERS.—For the convenience of advertisers, letters may be addressed to numbers at the office of this paper. When this is desired, the sum of 6d. to defray the cost of registration and to cover postage on replies must be added to the advertisement charges, which must include the words: "Box 000, c/o 'The Amateur Photographer'." Replies should be addressed: "Box 000, c/o 'The Amateur Photographer,' Dorset House, Stamford Street, London, S.E.1," and these letters will be simply forwarded by us to the advertiser. It must be understood that we do not deal with the correspondence in any other way, nor accept any responsibility in connection with the advertisement. Readers who reply to Box No. advertisements are warned against sending remittances through the post except in registered envelopes. In all such cases the use of the "Deposit System" is recommended.

Special Note

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post. When sending remittances direct to an advertiser, stamp for return should also be included for use in the event of the application proving unsuccessful.

Deposit System

Readers who hesitate to send money to advertisers in these columns may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Amateur Photographer and Cinematographer," both parties are advised of its receipt. The time allowed for decision is three days, counting from receipt of goods, after which period, if buyer decides not to retain goods, they must be returned to sender. If a sale is effected, buyer instructs us to remit amount to seller, but if not, seller instructs us to return amount to depositor. Carriage is paid by the buyer, but in the event of no sale, and subject to there being no different arrangement between buyer and seller, each pays carriage one way. The seller takes the risk of loss or damage in transit, for which we take no responsibility. For all transactions up to £10 a deposit fee of 1/- is charged; on transactions over £10 and under £50 the fee is 2/6; over £50 and under £75, 5/-; over £75 and under £100, 7/6; and on all transactions over £100, one-half per cent. All deposit matters are dealt with at Dorset House, Stamford Street, London, S.E.1, and cheques and money orders should be made payable to Iliffe and Sons Ltd.

CAMERAS AND LENSES

IMPORTANT NOTICE

Owing to the Christmas Holidays, the issue of "THE AMATEUR PHOTOGRAPHER & CINEMATOPHAGER" for December 26th must be closed for press earlier than usual.

MISCELLANEOUS ADVERTISEMENTS for insertion in that issue can be accepted up to **FIRST POST, WEDNESDAY, December 19th.**

WARNING

We have received many complaints from our readers in regard to the business methods of Mr. R. L. Green, trading as R. L. Green's Photographic Exchange, of 218, Fore Street, Edmonton, London, N.18.

For some considerable time we have refused to insert his advertisements in "The Amateur Photographer and Cinematographer," and from the complaints we have received it would appear that his practice is to communicate with private advertisers having goods for sale, offering to take such goods in exchange for others, or to purchase for cash. Readers are advised to ignore all such offers from this quarter.

CAMERAS AND LENSES

GAMAGES

First again! THE NEW 'CAMPRO' COMBINED CINÉ CAMERA AND PROJECTOR

**SHOOT AND SHOW
WITH ONE MACHINE
COSTING
ONLY 63/-**

**OR SUPPLIED ON FIRST OF 10
MONTHLY PAYMENTS OF 7/-.**

The "Campro" is no toy, but a well-designed and beautifully made instrument. Fitted with f/3.5 Estdar lens and accurately-governed Garrard motor. Used as a camera, it will take 30 ft. of 9.5-mm. film at one winding; used as a projector, it will project up to 60 ft. of film. Illumination is by special projection lamp working off a standard 7.5-volt dry battery or with the help of a special transformer (price 7s. 6d.) direct from A.C. mains. A brilliant and steady 2-ft. 6 in. picture is obtained.

Note these Special Points!

- ★ Special f/3.5 ESDAR Lens.
- ★ Fixed focus, 4 ft. to infinity.
- ★ Body made of special light-weight alloy.
- ★ Beautiful crackle enamel finish.
- ★ Ready at once as Camera or Projector.
- ★ Measures overall only 5½×4½×2½ in.

Half Bound Leather
10/6 net By post 11/-

"Photograms of the Year," the new edition of which is now on sale, makes an excellent Christmas gift for all who are interested in pictorial art.

Containing nearly eighty superb reproductions, selected from the best work of the world's leading photographers, this volume reveals the remarkably wide range of subject matter that comes within the scope of the modern camera artist.

Still-life, landscape, portraiture, posed figures, architecture and the artistic interpretation of apparently commonplace detail, are all presented with consummate taste and technical skill.

Obtainable from leading Booksellers, or direct from the Publishers

The AMATEUR^{3D} PHOTOGRAPHER & CINEMATOPHOTOGRAPHER

~ The Journal for Everybody with a Camera ~

Vol. LXXVIII.

Wednesday, December 19th, 1934.

No. 2406.

The above picture taken by ordinary stage lighting is enlarged from a portion of a Contax negative. For indoor photography or night or street scenes of all kinds the Contax with f/2 Sonnar is ideal. The following Contax publications are obtainable free on request: "The Connoisseur and the Contax," "The Ten Contax Lenses," and "Accessories for Contax Photography."

CONTAX

**THE IDEAL PRECISION
MINIATURE CAMERA**

In the Contax the miniature camera reaches its most perfect form. The following features are worthy of note:

- (1) The practical shape of the camera makes it easy to hold camera steady.
- (2) The back opens in the ordinary manner, and is, therefore accessible for cleaning and for the use of ground-glass screen and dark slide for special purposes.
- (3) Daylight-loading spools or lengths of naked ciné film in cassettes can be used.
- (4) Choice of 12 Zeiss lenses, all interchangeable. Varying foci from 1½ in. to 20 in., and in apertures f/1.5 to f/8.
- (5) Range-finder focussing coupled with lens. The base of the range-finder is approximately 4 in., thus giving accurate readings.
- (6) The all-metal focal-plane shutter gives exposures from ½ second to a guaranteed 1/1,000 second and Time exposures.

KNOW the freedom of working with speedy, precision equipment in photography's newest field—enjoy 35 mm. miniature camera photography the cheapest way—with a "Retina." Kodak resources enable the "Retina" to be sold for £10.10.0—the lowest price of any instrument of its type.

The speed you need for modern photography—*here it is*: Schneider "Xenar" *f*3.5 Anastigmat Lens in "Compur" Shutter (1-1/300th second).

High exposure capacity, low film cost per picture—both are yours with the "Retina." It takes 36 exposures at one loading on 35 mm. Kodak Film, supplied in new daylight loading and unloading cassette. Two fast panchromatic grades available: "Panatomic" and Kodak Super Sensitive Panchromatic. 3/6 per cassette of 36 exposures—just over a 1d. per negative.

For full details about this exciting camera get the free illustrated 16-page booklet "The World at Your Finger Tips."

"Photograms of the Year," the new edition of which is now on sale, makes an excellent Christmas gift for all who are interested in pictorial art.

Containing nearly eighty superb reproductions, selected from the best work of the world's leading photographers, this volume reveals the remarkably wide range of subject matter that comes within the scope of the modern camera artist.

Still-life, landscape, portraiture, posed figures, architecture and the artistic interpretation of apparently commonplace detail, are all presented with consummate taste and technical skill.

Obtainable from leading Booksellers, or direct from the Publishers

VOL. LXXVIII. No. 2406.

THE exhibition of American Photography at the Royal Photographic Society's House, 35, Russell Square, is well worth a visit this week, not only because it has been selected by 155 selectors, but because it demonstrates the great levelling-up of pictorial photography all over the world, since the "invasion" by American pictorial workers in 1900. On that occasion the newness, strength and brilliance of the work from across the Atlantic, when seen in the mass, was staggering to those accustomed to the conventional treatment of pictorial subjects by the British workers. Since then, not only the British, but all the other nations where pictorial work with the camera is practised, have gone ahead, and this collection, which contains some remarkably fine work, representing as it does the pick of the American pictorialists, has a very familiar appearance. A notice of the exhibition is given on another page in this issue.

Christmas Photography.

Apart from the possibilities presented to the amateur photographer nowadays for securing well-exposed negatives on dull days, or indoors at night by the aid of flashlight, photo-flood lamps and flashbulbs, there is little difficulty in making equally good photographs by the ordinary lighting of any room. The magicians of the laboratory give us emulsions of amazing speed, the opticians have still further increased the apertures of anastigmats, and the camera-makers produce miniature instruments that exploit these advantages to the limit, with the result that the ideal is now almost reached when the camera will record in a fraction of time exactly what

Christmas puddings for the Navy. A topical snapshot taken on Whale Island.

the eye sees, no matter what the lighting conditions may be. During the Christmas Holidays this year, more than on any previous occasion, there is no excuse for a single reader who possesses a camera, and a knowledge of how to use it, to neglect to make exposures. This particularly applies to the Christmas family-gathering. Such records are easy to secure with modern lenses, plates or films, and even if they are not always entirely pictorial they are subjects with a personal quality that renders them precious in years to come. The opportunity should not be missed on this occasion also to make use of the home ciné camera whenever possible. This is now well within the range of everyone possessing one of these instruments. A note on the subject is given in our ciné pages this week.

"Times" Have Changed.

Our note headed "Modern Photography" (page 503), in which the remarkable results obtained by Press photographers at the Royal Wedding were commented upon, has led an old hand to recall the exposures necessary when amateur photography was in its infancy. Our friend has discovered among his treasures a copy of Wormald's "Practical Index of Photographic Exposure," dated 1889, a guide which was very popular among amateurs forty-five years ago. The H. & D. speed numbers for plates were not known until the following year (1890), and the speeds were known as so many "times"—thirty times, forty times, and so on—the indicated times being the number of times a plate was quicker than a wet plate. The speed in common use was "thirty times," a speed which to-day would be known as

H. & D. 70, or thereabouts. F/8 or f/11 was the largest aperture the amateur of 1889 was in the habit of using, quicker lenses being rarer and more costly than they are to-day. The fastest exposure given in the tables, using a "30" plate and f/8, was one-tenth of a second, and this on a sunny June day between the hours of 9 a.m. and 3 p.m. In 1889 a few venturesome amateurs used a "60 times" plate, and these required half the "30 times" exposure. The "Index" gives a list of 75 different brands of plates.

A Free Lance.

Mr. Pollard Crowther was the same as ever, only more so, when he inaugurated the session of the Pictorial Group the other evening with an address. He said a great many interesting and amusing and emphatic things, chiefly about stage

photography. His Graflex camera, he said, had now made about 30,000 photographs. He and it had worked together without the slightest friction, though both of them had made errors. On technique Mr. Crowther was as vague as his photographs were sparkling and clear. He accepts the principle of the late Mr. N. E. Luboshez, whom we remember once telling us, when asked what exposure he gave, that he "held the bulb and let go when he thought it had had enough." But he got fine results, and so does Mr. Crowther, witness his present exhibition of theatrical photography at Russell Square. Incidentally, he gave us some useful if rather indefinite information about the Royal Wedding. He declared that every single film used on that occasion, which to begin with was hypersensitised, was further hypersensitised with a certain chemical, half

an ounce of which, and ten minutes' immersion, increased the speed by 40 or 50 per cent for the next forty-eight hours, but no longer. Mr. Crowther having, as he said, no head for chemical formulæ, could not remember the name of this substance, and when he did come across it could not pronounce it.

A Treacherous Camera Stand.

A Press photographer tells us of a sad incident on the occasion of the photographic reception of a famous American film star. The reception took place on the roof of the Carlton Hotel. One of the enterprising camera-men had the great idea of using the chimney as a camera rest. He placed it in position, and went back to arrange his subject. When he returned that camera had gone down the chimney—and the subsequent proceedings interested it no more.

R. CHILD BAYLEY

An Appreciation by LORD ILIFFE.

BY the death of Mr. R. Child Bayley, I have not only lost a valuable business colleague, but also a close personal friend of more than thirty years' standing.

In these few words of appreciation, I do not propose to deal with the many incidents which fly to my mind in connection with Bayley and his work as Editor of *Photography* and *The Amateur Photographer*, and later as a Director of Iliffe & Sons Ltd., which latter position meant for him much wider commercial responsibilities.

The business side of Bayley's life has already been referred to by Mr. F. J. Mortimer, the present Editor, and I propose to confine myself to a few notes concerning him as a man and a friend.

Bayley, although of a retiring disposition, had a great capacity for friendship. It has been my good fortune to spend many holidays with him, ranging over a long series of years. I always found him a delightful companion, adaptable, more than usually well informed, and with an irresistible sense of humour.

His main hobby was reading, but he would have nothing to do with the modern novel. Dickens, Scott, Anthony Trollope, he knew almost by heart, but he was always a little reluctant to admit that the modern novelist produced anything worth reading. I did, however, once manage to persuade him to read Galsworthy's "Forsyte Saga," and Arnold Bennett's "Old Wives' Tale," which seemed to modify his judgment.

Next to the Old Masters to whom I have referred, Bayley loved to read biography, and particularly historical biography. His knowledge of Napoleon and Napoleonic history was unusually extensive.

Perhaps his most striking characteristic was his remarkable independence of judgment. That stood him in good stead in business, and it certainly added much interest and power to his conversation. His judgment was always formed as the result of a careful study of the merits of a case, and he would not allow that judgment to be deflected in the least by sentiment. It was therefore always very worth while to obtain his views upon any matter. In business, I have often put before him a problem in which he had no personal concern, and invariably the doubts and difficulties have been dispelled after he had brought his clear and analytical mind to bear upon it.

Child Bayley for many years past has spent his Christmas holidays at my house in Berkshire, and he will be greatly missed at the family gathering, for he was just as popular with the younger generation as with those of his own age.

He always had at hand a remarkable fund of stories which were ever apropos of the conversation of the moment, and used to tell these stories with inimitable good humour.

Our Christmas cheer is always mixed up with a good deal of exercise, but Bayley would have none of that. When exercise was afoot, even a mild walk with the guns, he would retire happily with a book.

Bayley was a man of great loyalty and affection. He seemed to try to hide the sentimental side of his character, regarding it as a weakness, but in that he was not altogether successful.

His loss has left a blank in my own immediate circle, which will not easily be filled.

STILL-LIFE

indoors in comfort and can use either daylight or artificial light without regard to length of exposure; while the subject-matter is entirely under his personal control. In the following article the general principles of still-life work with the camera are outlined.

STILL-LIFE photography provides both an excellent way of spending a cold winter's evening and practice in technique and composition. It also provides an incentive to constructive artistic effort, and should be practised by all who wish to take photography seriously.

Still-life should, however, be approached from a definitely pictorial point of view, and not as a mere exercise in technique. It is not sufficient to take photographs of a more or less miscellaneous assortment of objects arranged in such a way that they conform with the rules of composition. It is not sufficient so to arrange the lighting that some simple object assumes a new strange shape or wonderful pattern, and many "stunt" photographs fail because of this.

Pictures with a Purpose.

Good photographs only become good pictures when they convey some message; when by his arrangement of suitable objects the artist expresses an idea. This is not to be interpreted as a recommendation to avoid the practice of so-called "stunt" photography, which becomes eminently successful when inspired by artistic motives.

Thus, before deciding upon a still-life group the worker must first decide what it is that he wishes the group to represent, or what idea he intends to convey, and this is essential.

It is useless to collect together ornaments, fruit and flowers, or the hundred and one things useful for still-life studies, hoping for an inspiration. The inspiration must come first, when it will be a comparatively simple matter to collect the necessary material, all of which should be in keeping with the subject.

The number of objects chosen should be as few as possible consistent with adequate expression and the requirements of composition,

and the lighting should be of a simple, straightforward nature, arranged principally to emphasise the modelling and texture of the objects composing the group.

Lighting.

Except where some particular arrangement of light and shade is necessary to enhance the expression of an idea, the main source of illumination should be fixed so that the light falls upon the subject at the usual angle of about 40 degrees. The shadows can be relieved by reflectors or by another light source above the camera. Too strong an illumination should be avoided, because this raises the contrast by throwing deep shadows, and the shorter exposures involved cannot be considered worth while when the camera is already mounted on a tripod and there is no fear of movement.

For normal conditions a satisfactory arrangement is provided by setting up the camera under the ordinary room light and providing the main illumination by means of another light of similar power somewhat nearer and to one side of the subject. If it is necessary to use flashlight, a long enough time exposure should be made with the ordinary room lighting to secure adequate shadow detail, whereupon the firing of the flash will provide the angular main light. The duration of the time exposure must vary according to circumstances, and can only be decided by actual experience.

Camera and Lens.

There is no camera better than the stand camera for dealing with still-life studies, but any camera provided with a focussing screen will answer the purpose very well. Wide-aperture lenses are only useful to facilitate focussing, and should be stopped down when making exposures if adequate depth of focus is to be secured.

A long-focus lens is very useful

Still-life provides the amateur photographer with an ideal outlet for his picture-making desires at this time of year. He can work

in providing good modelling and perspective, or, alternatively, the camera should be set up at such a distance from the group that the whole of the plate is not required to contain the subject, extraneous surroundings being removed by consequent trimming after making an enlargement.

If a stand camera is not available, and the worker is equipped only with an ordinary roll-film camera with no focussing screen, these subjects can still be attempted, although the work is not quite so easy and certain. The camera should in any case be securely attached to some firm support to enable a prolonged time exposure to be given. The objects to be photographed should be on a larger scale, to permit them to be taken at a greater distance, and the focussing must be accomplished by careful measurement of distance in conjunction with the focussing scale.

Arrangement.

In the ordinary way it is advisable to stick to negative material with which one is quite at home, but with still-life subjects that will not run away, or can be re-arranged at will, we have an opportunity of trying out and making ourselves familiar with new material.

It will often be found when making photographs of a group of objects that the balance of composition is upset by the light falling upon the one side, one side of the picture being light and the other dark. This fault can be avoided by arranging the background so that its tones vary from light to dark from the dark side of the subject to the light. This can be secured by the use of hangings of different tone or colours, but for flower studies, fruit, and similar subjects, a plain neutral background of smooth brown paper—continued to form the base on which the object stands—is generally the best for the purpose.

C. M.

Christmas-time

An Illustrated Note on a Topical Subject.

By GEOFFREY NORTON.

The Lure of the Shops.

AT all times of year, street snapshot work has a fascination for the amateur photographer. This is due largely to the endless variety of the human subject-matter and to the fact that it is always available.

In the past, however, this type of work was restricted to

summer-time or to very bright days during other periods of the year. Nowadays, the matter of light by day, and even at night (provided the streets are brightly illuminated) is a secondary consideration.

The shopping centre of any town at Christmas time can be a happy hunting-

Her Lucky Day.

The Pavement Market.

A Difficult Problem.

ground for camera pictures. Every shop window attracts character studies of some sort or another, mostly potential purchasers, of both sexes and all ages.

Particularly attractive are the studies of children in the neighbourhood of toy-shops. Here is a subject of unlimited possibilities. The intense concentration of the kiddies gazing

Making Sure.

Street Snapshots

at what the Christmas shop-keeper has to offer renders them entirely delightful models for the camera. The photographer has only to sally forth on any bright morning into the principal shopping street at the present time immediately before Christmas to realise the wonderful material that is available for picture-making.

The owner of a miniature camera is particularly favoured, as with most subjects of the sort rapid action in the use of the camera and a comparatively quick shutter exposure are necessary to make

the most of these subjects. It is not a matter of "stalking," but of being ready on the instant that the subject assumes the best position for a snapshot.

In this respect the miniature camera, or a camera that can be used promptly, and the film changed and the shutter set rapidly, has everything in its favour.

In view of the general low actinic quality of the light at this time of year it is desirable, however, that the lens should be of the largest possible aperture, and the films of the highest possible speed. Here, again, the miniature camera scores, and street snapshots, even

on dull days in December, can produce fully-exposed negatives if an aperture of $f/3.5$ is used in conjunction with one of the super-speed panchromatic films.

The Self-Taught Amateur

HALF a dozen perfect negatives of a variety of subjects lie before me, the fruits of eighteen months' solitary apprenticeship in photography. A poor showing for so long a period? Perhaps, but the point about these negatives is that each represents exactly what was sought from diverse conditions and subjects. Preliminary survey, light testing, viewpoint, exposure and development—all were just right, and the results are precisely what were envisaged each time the camera was taken from its case. Moreover, I can be reasonably sure of repeating this measure of success, or at least of being able to recognise where I have gone astray. "All my own work" has a special significance in this case. Circumstances make me a lone-hand learner, dependent solely on textbooks, instruction pamphlets, and the invaluable "correspondence course" supplied weekly by "The A.P."

Recruits enlist in the army of amateur photographers from many motives. I bought a camera with the unromantic purpose of providing myself with an interest apart from daily work that was absorbing too much mental and nervous energy. From this neurological point of view the hobby was a success from the outset. It provided a needed counter-irritant of inexhaustible possibilities. But I made a false start. My first camera was an inexpensive miniature, a nice little instrument, but a poor instructor in fundamentals of photography. Despite careful exposure records, by the time a spool was finished and tank developed, individual exposures had lost identity and mistakes were difficult to ascribe to the right cause.

So the miniature was replaced by a plate camera; and from that moment I began to understand how and why things happen. For others who of necessity must be self-taught, I offer some suggestions for a systematic approach that minimises wastage of time and materials.

The essence of my system is to expose two plates on the same subject, one at the orthodox actinometer reading for "control" purposes, and the other with such variation as is being studied. Develop both together by time and temperature. After mixing the dark slides I saw the virtue of a

slight shift of viewpoint for the second exposure, so that there could be no confusion between the finished negatives.

One may as well choose subjects with pictorial possibilities for these test exposures, though that is not the prime consideration. The "control" negatives are not wasted. They are useful at a later stage for observing the relationship between negatives and different grades of printing paper; for experimenting with intensification or reduction; and for acquiring skill in spotting and retouching.

It is a good idea to desensitise ortho plates and develop in a bright light as used for gaslight paper manipulation. Then one can see with ease and comfort just how an image builds up, and the progressive stages of development. Time and temperature should be regarded as a sheet-anchor; having seen the effects of under- and over-exposure, of the differences made by use of a filter, and of what can be done to correct negative deficiencies by choice of paper.

Desensitising and close inspection, with time and temperature always as a foundation, is especially useful at this stage. So few experts realise the inadequacy of printed instructions for the man who has never watched a negative develop, and has to learn to recognise the difference between under-exposure and under-development.

Thus one may learn to counteract excessive contrast in the subject by over-exposure and shortened development, and to make the best of a dull, flat subject with the minimum exposure and prolonged development. Time and temperature tables usually carry instructions for dealing with such extremes, but the written word is no substitute for practical experience. Comparisons with a normally exposed and developed "control" negative will show the effects of variations in procedure that literally have to be seen to be believed.

This is all very elementary, no doubt, but I do not see how it can be acquired by a learner working on his own otherwise than by systematic experiments with negatives taken in pairs, and followed through all stages to the finished prints. Conscientious record-keeping is essential in this or, indeed, any other method. H. W.

TO photograph one's friends and members of the family is an intriguing pastime, and plenty of opportunities occur at this time of year. The object of this article is to promote in the amateur a desire to make pleasing portraits devoid of the crudeness which is so often prevalent in the efforts of amateurs.

The chief problem from the amateur's point of view is a suitable light source. Daylight can be used quite effectively, but cannot be controlled so easily as artificial lighting, particularly when only one window is available, as there is a tendency to get harsh results, with too much light on one side of the face and not enough on the other. By combining daylight and artificial light this objection can be overcome. If this method is adopted orthochro-

Simple Home

Photoflood lamps are excellent for home portraiture. They give an equivalent of 750 watts and can be used from the house lighting. These lamps have a working life of only one and a half to two hours, owing to the high intensity at which they work, the voltage rating being lower than the voltage of the current used; the price is reasonable compared with other lamps. It is not necessary, either, to leave the lights on all the time.

A shadow cast by the sitter on to the background often helps to give a more striking appearance. The sitter must be close to the background to get the above effect. In this case two lamps were used, one above the other, about seven feet up and about four feet from the sitter. A white reflector was used on the opposite side.

matic or panchromatic material must be used, otherwise the artificial light will have little or no effect.

In these days of ultra-fast plates and films and fast lenses there is no reason why the ambitious amateur should not adopt artificial light entirely.

Various firms make portable lighting sets which are inexpensive, consisting of a high-powered lamp and reflector with or without a stand. A disused bowl-fire will make an excellent reflector if painted in aluminium; then all you have to buy is a lamp with a screw fitting costing about sixteen shillings. If your house is wired with a power circuit you can burn as many lamps as you like, but if only the house lighting is available it is not advisable to use more than 300 watts, and then all other lights should be turned off.

This is a semi-firelight effect. The "firelight" comes from a lamp immediately in front of the sitter and one foot from the floor. If this were used alone there would be harsh shadows on the cheek-bones and over the nose, so a subsidiary lamp is introduced to the left of the camera and about seven feet up to give a softer, more general lighting.

Another illuminant recently introduced is the photo-flash lamp, which, although not specially adapted to the needs of portraiture, enables one to take unusual pictures indoors with an instantaneous exposure.

The first essential in portrait lighting is to control the intensity of the light. Too much light is just as bad as not having enough. The intensity can be controlled in two ways, either by diffusion or by moving the light farther away from the subject. If light comes from both sides of the sitter, one of the lights should be farther away than the other, so that the one which is nearest provides the main light source and the other becomes a subsidiary. In the event of only one light being available, a reflector consisting of a sheet, a piece of white card, or a mirror, is absolutely essential to relieve the shadows. A single

Portraiture

By
**BERNARD
CUTHBERT.**

light should never be placed square in front of the sitter (this gives a flat, uninteresting result), but to one side, and at an angle of about forty-five degrees, with a reflector on the opposite side, as already mentioned.

By combining daylight and artificial light, a good "Rembrandt" effect can be secured. The background should be placed immediately in front of the window with space at the top to allow light from the top of the window

will be a stepping-stone to success. The following few hints will probably be of use to the beginner. The sitter should not be posed square to the front; this gives an appearance of too much body and not enough head; at the same time it is not advisable to take a side view of a narrow-chested person. The head should be tilted at an angle away from the line of the body. In other words, if the sitter is leaning forward the line of the head should be more or less vertical.

The direction of the eyes should follow the natural position of the head. They are the most compelling feature in a person's face and should accordingly be made the most of. A sitter with blue eyes must not be made to face direct light, or they will look too pale in the photograph.

An example of the "outdoor type" of portrait. A light background should be chosen (in this case a pale distempered wall) as it helps to give the right atmosphere. A light, seven feet high, is within five feet of the sitter, and another, much lower and with a diffuser of muslin in front and about eight feet away, and this helps to soften the shadows on face.

to be used. The sitter then takes up a position about three feet in front of the background so that the top light from the window shines down on his (or her) head and shoulders. This gives the Rembrandt effect. The features are then illuminated by artificial light in the usual way.

The choice of a suitable background is a point which deserves serious attention, for a background can make or mar a portrait. Irritating details and bright splashes of colour detract the attention from the subject, which should predominate.

A prominent background can be subdued to a certain extent by having it out of focus.

Correct posing of the sitter is only acquired from experience. If we profit from our failures, then each failure

The picture above shows what can be done with only one lamp plus a reflector. The lamp is seven feet high and four feet from the sitter, is placed practically on the same plane as the background, i.e., slightly behind the plane occupied by the sitter, and protected by a shade from impinging on the lens. The white reflector is about three feet from the sitter and illuminates the shadow side.

Dark eyes and deep-set ones require the use of a mirror or small light to give them sparkle. Taking the wrong viewpoint will often give a distorted appearance. A sitter with a long neck and/or a snub nose will look better from a high viewpoint, but if a sitter with a short neck or a long nose were taken from this position the head would look set right on top of the shoulders with the neck invisible, while the nose would protrude across the line of the mouth. Hands require a lot of attention, and it is best at first to leave them out of the picture. If they are included they should be kept in the same plane as the rest of the figure with only a subdued light on them.

The exposure will vary with the brightness of the light, stop, and speed of plate or film. The examples herewith averaged 2 secs. exposure, f/4.5, pan. film.

A Useful Cold-Weather Heater By VICTOR ROBERTS.

FEW amateurs are so favoured to be able to command a room with a maintained temperature of 65 degrees. More often than not during the colder months of the year one is compelled to work in one with a temperature of about 45 degrees.

Provided the necessary additional development time is given, such developers as Azol, Rytol, Rodinal, etc., will

The heater illustrated was designed to overcome this difficulty, and does so most successfully.

It consists of a wooden box $10 \times 8 \times 4\frac{1}{2}$ in., outside dimensions, and is constructed of 5-ply wood. Any other could be used provided it is of sufficient thickness to withstand the heat and not warp.

The lid is made of stiff zinc turned down sides of box about 1 in. If this should not prove light-proof, a narrow strip of

Interior of the heater, showing the lamps and switch.

The heater in use, with zinc lid in position.

help to overcome this to a certain extent, but any formula which contains hydroquinone will prove disastrous to good results.

Various expedients are recommended from time to time to meet the need, such as placing the developing dish within another containing heated water, or standing the dish on a heated brick, etc. Though serving their purpose provisionally, these methods are messy and troublesome if the required temperature is to be maintained.

thick felt glued to the top edge of the box will cure, when lid is on and dish on top.

It can, of course, be made in any other size, but that given was chosen for use with a whole-plate dish and less. The heater consists of two gas-filled 60-watt lamps of the necessary voltage wired in parallel. The switch on end of box is necessary as a working temperature of 70 degrees is soon attained, after which an occasional switch on is all that is required to maintain it indefinitely.

Portable Lights for Home and Outdoors

By W. R. LEE.

DURING the winter months, and particularly around Christmas-time, some safe and handy form of extra lighting in the home is of great advantage, and a portable spotlight an immense help. The chief points of interest about the device now described is that it can be used either as an extra light, with an ordinary electric bulb or with a photoflood bulb, or for firing a Sashalite bulb, while it is exceedingly cheap and easy to make up.

The reflector is an aluminium bowl 7 in. in diameter. This, with the bayonet cap bulb-holder, two yards of twin flex, and an adapter plug, costs 1s. 9d., and no more than this is required to make up the spotlight.

A hole must be cut in the bottom of the bowl to take the lamp-holder, to which one end of the flex is con-

nected, whilst the plug is attached to the other end. In use a bulb is taken from any convenient point and placed in the holder fitted to the bowl, the plug at the other end of the flex going into the point from which the bulb has been taken. Thus is obtained a portable light-holder, the rays from which may be directed anywhere.

So far well and good, but the arrangement that has been described up to now will be of no use to the photographer if he is any distance from the household light supply, or out in the country where there is no electric light; but it can be easily varied to enable it to fire a Sashalite bulb.

All that is wanted is an adapter to screw into the end of any pocket torch after the lens and bulb have been removed, costing a further 1s. 8d.

This adapter is seen just in front of the torch in the illustration, and it will be clear from this that the plug on the end of the flex will also fit into this adapter, while the Sashalite bulb goes into the bulb-holder already fitted to the bowl. When all is connected up, a matter of seconds only, the reflector can be placed anywhere within the limits of the flex, and the bulb "fired" when desired by the photographer whilst still at the camera. This is an advantage over the self-contained type, for as the bowl-shaped reflector will stop any back rays of light it can be placed in front of the lens if needed with no harm resulting, provided it is so set as to point away from the lens.

The arrangement described only applies to the standard bayonet cap

bulbs as fitted to house lighting, and the small size Sashalite bulb, for some reason the larger-sized Sashalite has a small screw cap fitted to it. Finally, do not use light flex, and make sure all your electrical connections are clean and tight. Provided your connections have been well made and your torch battery is not too old all will go with certainty, and the cleanliness and convenience of this method, once tried, will be ample compensation for the extra cost of the bulbs, and neither wind nor rain will make any difference to its working in the open for exteriors at Christmas-time with carol singers or "waits."

The Royal Wedding Pictures

By HERBERT LONGBOTTOM.

The keen amateur may learn much from an analytical study of the fine photographs issued by the principal newspapers and periodicals.

THE recent Royal Wedding was a day of great achievements in Press photography. The weather conditions could scarcely have been worse, but our daily papers, and then the weeklies, have been full of splendid pictures. Cannot we amateurs learn a great deal from a close study of these Press pictures? Suppose we ask ourselves a few questions about them. In face of the difficult weather conditions, what plates or films were used, and what focal lengths of lenses, at what apertures? Note, especially, the great depth of focus in many of these pictures.

I spent a thoroughly interesting evening in speculating on these queries, with but a hazy knowledge of the actual methods of Press photographers. It has been stated by one of the more famous of these men that few of them are yet converted to the miniature cameras. A goodly number will have been converted by this event. Careful consideration of Press pictures in general leads one to the conclusion that these experts always use the smallest aperture possible in the circumstances, so as to secure good depth of focus, especially in their crowd work. The shutter is set to the minimum speed required to arrest whatever movement there may be, and the lens adjusted to the light conditions (the plate or film speed being almost constant). For example, if $1/50$ th second would arrest movement, and lighting permitted, they would use $1/50$ th at $f/8$ rather than $1/250$ th at $f/4.5$. But this hypothesis is based on the assumption that the Pressman is using one of the "old type" of Press cameras, with its usual lens, say a 6-in. lens on a 5×4 in. plate. Are we correct in assuming this type of camera was used? Or were the modern miniatures preferred?

It is especially interesting to analyse the pictures of the Abbey ceremony, as reproduced in *The Times*, the *Daily*

Telegraph or the *Daily Herald*—all equally good. First of all, note that the architectural verticals are true; the old trick of swinging the camera back to get depth of focus cannot have been used. Let us assume that the lenses were focussed on the plane occupied by the King and the Church dignitaries. The hyperfocal distance of a 6-in. lens working at $f/4.5$ is approximately 100 ft., if the lens be focussed on infinity. The cameras, however, were probably between fifty and sixty feet from the King, and the hyperfocal distance would then approximate to 40–100 ft. at $f/4.5$; 35–70 ft. at $f/3.5$.

Using a 3-in. lens working at $f/3.8$ on a 6×6 cm. film or plate, focussed on 50 ft., the hyperfocal distance would extend from 25 ft. almost to infinity.

A modern miniature camera, with a lens of 2 in., and working at $f/2$, would give us, at this large aperture, sharp focus from 36 ft. to 80 ft., and the wealthy Pressman has available, too, a comparatively long focus lens working at $f/1.6$, and giving him from 42 ft. to 60 ft. in focus. These distances approximate to the closest and farthest features of the pictures we are considering.

If we remember that the modern high-speed fine-grain films will stand enlargement to ten or more diameters without showing appreciable grain, we can at once assume that, to-day, a plate 5×4 offers little or no advantage, from the viewpoint of a good, bright enlargement, over the miniature size. What advantages, apart altogether from those already considered, does the miniature offer over the older type of Press camera? The shutter action is quieter, it is more easily carried, it is almost unnoticeable when in use, and it has facilities for anything from 12 to 36 exposures in rapid succession. The photographs reproduced suggest exposures of one-fifth or one-tenth second; there are many signs of slight movement. On

such an occasion no Pressman would be satisfied with one or two shots; some notable might have moved in that short space of time. Alternative negatives were important.

And what can we learn from the outdoor photographs of this great occasion? The telephoto snaps of the Royal Family on the balcony of Buckingham Palace show decided signs of grain—just compare them with the reproductions of the "studio" groups. This graininess again suggests the use of a miniature camera using a telephoto lens and fast film (not so fine of grain as it would have been had the conditions been brighter). Probably a haze-cutting filter was used. For work like this there is available, for the miniature user, a lens of $5\frac{1}{2}$ -in. focus working at $f/4.5$. Its equivalent on a quarter-plate camera would be 18-in. focus—a lens surface the size of the palm of your hand and costing a small fortune. And this $5\frac{1}{2}$ -in. telephoto is by no means the limit of magnification with these miniature cameras. Nowadays the Press spends money lavishly on its pictures. For £300 they can secure a long-distance lens, working at $f/5$, with a focal length of 40 in., or the equivalent of something near 130 in. on a quarter-plate.

Many pictures have been used showing the Duke and Duchess in a car. Just observe that although these have been taken at fairly close quarters the head images are almost identical in size, and although possibly two feet apart they are equally sharp. Again the miniature camera is suggested, possibly with a medium long focus lens with an aperture of $f/1.9$. At five yards distance such a lens has a depth of field of nearly two feet at open aperture, and a focal length equivalent to a 10-in. lens on a quarter-plate.

Is it any wonder that the experts tell us that the modern miniature camera is the all-purpose camera of the future?

With the Beginners

Every week an article will appear under this heading dealing with a topic of interest to the novice in photography.

NOTES & NOTIONS
for the
LESS ADVANCED
WORKER

POINTS ABOUT DEVELOPMENT.

AFTER the interruption in my discourse resulting from the intrusion of the Christmas Number, I want to say a few more things about development. No one can dispute the important part it plays in photography, and all those who are wise enough to do their own work must make a point of getting a good idea of the principles of these operations.

Unfortunately there are a good many beginners who really do not know what satisfactory negatives are. The sooner they find out the better, and there are few who cannot do this quite easily, especially if they belong to a photographic society. The best plan is to ask one or two capable workers for a sight of their negatives, because there is a certain amount of variation in the appearance of the best negatives. All of us manage to get a "perfect" negative at times, and the oftener we can reach or approach that standard the better.

I have already, I think, made it clear that the time and temperature method of development is an excellent one, although it cannot be expressed by stating one single definite development time as some suppose. And I have given the reasons for this.

It may further clear up the matter if I refer to an actual example. If you get a Kodak tank outfit for roll films, it is accompanied by a booklet giving complete and lucid instructions for using it. Amongst these is a table of development times at different temperatures, and a thermometer is part of the outfit. But—and this is important—the table assumes the use of Kodak films, and of Kodak tank developer. In such a tank, and under the definite conditions laid down, I have developed hundreds of negatives, and I do not think that I could have equalled the average results by any other method.

But if I use another kind of film, or a different developer, the case is altered. It is quite likely that the development times that were correct before would have to be halved or doubled.

It is for such reasons that it is bad policy to be constantly chopping and changing with sensitive materials and developers. We don't know where we are; and it is certain that at times we shall run up against serious difficulty and disappointment. The only safeguard is that when we do make a change we provide ourselves with information as to the modifications in procedure which that change necessitates.

There is another guide to development which is interesting, and in many ways helpful; although, like other systems, it has its snags and shortcomings. Mr. Watkins, of meter fame, discovered many years ago that there was a reasonably definite relation between the time of the first appearance of image on the negative, and the time taken to secure a certain degree of density and contrast.

Both of these times varied very considerably, according to exposure, constitution and strength of developer, temperature, sensitive material used, and the required character of the negative. But on all these points

sufficient information is available to enable allowance to be made for them, so that the method can fairly be called a system.

It is known as the "factorial" method, because in every case there is a factor or number, by which the "appearance" time has to be multiplied to find the "development" time.

I again quote from the Burroughs Wellcome Diary to give examples. The three factors given are for soft, normal and strong contrast respectively.

| | | | |
|--------------------|----|----|----|
| Rytol (normal) .. | 10 | 12 | 15 |
| Tancol (double) .. | 8 | 10 | 12 |
| Amidol (normal) .. | 7 | 10 | 12 |
| Hydroquinone .. | 3 | 4½ | 5 |
| Metol .. | 20 | 30 | 35 |
| Pyro-soda .. | 4 | 6 | 7 |

The developers named are the B.W. Tabloid forms, and similar developers made to another formula would probably require different factors.

It is necessary to have a good safe-light, which should always be the same; and a watch or clock as a time-keeper. The plate is laid in the developing dish, and at the beginning of a noted minute the developer is applied and the dish gently rocked. The plate is closely watched, and seconds accurately counted till the first appearance of a faint grey on the negative. The number of seconds is then multiplied by the appropriate factor, and for the whole of the resulting time the plate is kept covered without further observation. It is then rinsed and fixed.

Suppose, for example, that we are using B.W. pyro-soda, that we want a negative of normal contrast, and that the first sign of an image appears in 40 seconds. We see from the table that the pyro-soda factor for normal contrast is 6. Multiplying 40 seconds by 6 we get 240 seconds, so that we must give the plate 4 minutes from the time the developer was applied. If we had wanted a soft, delicate negative, the factor is 4, so that we should then have developed for 160 seconds only, that is 2 minutes 40 seconds.

The method allows for different emulsions which take different times for image appearance. It also allows for the rate at which different developers produce a certain degree of contrast. For example, although metol brings up the image quickly, it is slow in building up density, and that is why it has a high factor. Hydroquinone, on the other hand, piles up density quickly, and therefore has a low factor.

Some experience and a considerable amount of gumption are required to work this method, but it has many good points, and within reason is sound both theoretically and practically. It is very fully dealt with in the "Watkins' Manual of Photography."

Perhaps the greatest drawback is the necessity of exposing the plate for some time to light, and that at the very stage when it is most susceptible to fogging. This can be countered by previous desensitising, which would, of course, be imperative in the case of panchromatic and super-speed plates; and in some circumstances it will be

December 19th, 1934

found that this preliminary operation involves some modification of the factor.

The method can be used for flat films as well as plates, but is not really applicable to roll films.

Many old-fashioned workers, like myself, still rely more or less on developing by observation. There is much to be said for and against it. It certainly involves experience, and that is why the more mechanical methods have an advantage for the beginner.

In my own case I am helped by the fact that for all ordinary purposes, apart from tests and experiments, I use only a limited range of sensitive materials, with the individual characteristics of which I am familiar. I also use a standard developer which I know equally well.

It is therefore quite a usual practice with me to apply the familiar developer to the familiar plate, and cover the dish at once. I know within a little when I can take a peep at the plate to see which subject it is, as this will probably affect the degree of development it will receive.

Later on, I know what the *back* of the negative will look like, and what it *should* look like, according to the subject, and the kind of negative I am aiming for. But, as I say, this needs experience. There are cases where a patch or two of light grey on the back will indicate that it is time to stop; there are other cases when the whole of the back, except the margins, is a more or less even grey. I know which is which, and why; and that clearly means a good deal of past observation.

W. L. F. W.

THE MEMBERS' SHOW at the CAMERA CLUB

A well-known exhibitor has written us in regard to the winning picture at the exhibition of members' work now open at The Camera Club, 17, John Street, Adelphi. We publish his communication, and in order to make the matter clear to our readers we print a reproduction of the picture in question. By the courtesy of Miss Mary Haddon, author of the picture, we also give a straight print of the original subject.

"SOME description of the photograph entitled 'Toil,' which was awarded the only prize at the Camera Club Members' Exhibition, may not be out of place.

This remarkable picture purports to represent a pair of farm horses laboriously dragging a machine mower up a steep hill. That the near horse is a horse is a matter of conjecture. Both animals are silhouetted solid black against the sky, which although it illuminates the driver, leaves his team in darkness. The outline of the dubious animal's head and neck is that of a prize bull. The steepness of the field is shown by the angle at which it cuts the (over-corrected) sky, and it might have carried conviction had it not been for the following factors: (1) The trees on the horizon, instead of following the usual rule of growing fairly upright, like the hill itself are set at an angle of about thirty degrees to the straight. (2) The horses, instead of following the usual and only possible course of leaning forward when pulling a weight uphill,

The Prize Picture.

The Original Print.

are both leaning back. (3) The farther horse is actually backing, which is not an aid to effort and progress on a hillside. (4) The near horse (or bull) is gently ambling as if in Rotten Row. (5) The driver is portrayed as falling backwards out of his seat on the implement. In fact, he is only secured *in situ* by hauling on the reins.

From these peculiarities it is obvious that the photograph (an under-exposure) was of a flat field, and it is conjectured, from the attitude of both man and beasts, that the latter were being pulled up by the driver so as to give the photographer a chance of winning the prize. The semblance of a hill, which has no doubt misled the judge, was caused by tilting the camera quite a lot, sideways, or tilting the print similarly before trimming.

The show itself contains quite a lot of sound and artistic photography, the merits of which seem to have escaped recognition, and much good stuff was crowded out."

How I make my EXHIBITION PICTURES

No.
CCLX.

—
Mr.
WALTER
LEE.

Methods and Ideals of well-known Pictorial Workers.

From information communicated to our Special Representative.

"WITH me the making of an exhibition picture begins before I open the shutter of my camera. I must have something before me that makes a strong appeal—something extraordinary in shape, composition or atmosphere. I must from the very start be carried away by some kind of inspiration.

"Having got my inspiration I then try to reduce what is before me to terms of photography. I try to see in my mind's eye what my finished production shall be like. I find out if it is any advantage to move my camera higher or lower, right or left, or tilted up or down. If it is a landscape, I ask myself if the exposure shall be normal, or if less or more will

help in any way. Development I make as far as possible a mechanical process.

"My next step is a direct print (either $3\frac{1}{2} \times 2\frac{1}{2}$ or half-plate are the sizes I work), and with the help of four strips of card I find out approximately the part that I intend to use, and the shape my finished print shall be. I often take these prints and strips of card about in my pocket, so that at odd moments I can experiment. I have found it amazing what trimming will do for the picture-maker.

"Enlarging is the next stage. For a start I mostly make the print 12×10 on chloro-bromide, and if the subject is in a rather high key and the print is full of gradation I use my strips of card again; placing the print on the floor and standing on a chair I find I am able to get farther away and the strips are easily adjusted in this position. Should the print not please me, and if the tones require adjustment, or the shadows are not velvety enough, I roughly make the alterations in pencil and keep the result as a guide.

"Then I make a bromoil print. I have tried almost every photographic process, but I think I have found most pleasure in bromoil—one gets that extra little something that seems unobtainable any other way. For instance, 'Nativity' was a flashlight, taken upon a stage the front of which was not so very much higher than the heads of the figures, and heavy curtains hung across the back. I was greatly impressed by the performance, and bromoil was the only medium by which I felt I could give an impression of the effect it had on me. Mind, I don't think bromoil is suitable for everything—some pictures can be rendered much better and easier in chloro bromide.

"Having got the print to my satisfaction, I make my final trim, and mostly mount upon a piece of cream card with about $1\frac{1}{2}$ -in. margin all round. Now come the finishing touches. If high-lights require lightening, I do this with a knife, occasionally holding my print before a mirror so that I can see it reversed. Also I turn it upside down, as this gives me the opportunity of seeing it with fresh eyes.

"Next comes the mount. I usually cut this out of rather thick card, lay it over the print, and fasten at the back with gummed tape. I am not sure that this is the most artistic way of mounting, but it has the advantage that it protects the surface a little from rubbing.

"Reading this, one may think that exhibition pictures are produced fairly quickly. It is not so with me. Some of them are months from the taking to the production of the finished article. That is why I say that for the enthusiastic photographer the days are never sufficiently long, and life will be all too short."

PICTURES of the WEEK

Some Critical Comments on the Beginners' prints reproduced on the opposite page.

THERE is quite a pleasing sort of sequence about the arrangements of the figures in No. 5 of the prints reproduced on the opposite page—"The Fishers," by Ian Neill—and not a little interest attaches to their placing, almost precisely, on one of the diagonals, but there does seem just a touch of confusion in the presentment of the nearest lot.

Figure Isolation.

It is, of course, appreciated that it is rarely possible to secure a group of figures in exactly the arrangement that could be wished, and, whenever they are dealt with, it generally seems advisable to make a number of exposures, choosing a favourable moment for each, and leaving the final choice to the one which, on consideration, is found to be the best.

Here, the first figure, in himself, is quite well caught, but there is another behind with which he appears to be mixed up, and one farther in the rear which adds to the confusion. The fourth and fifth figures, on the contrary, are admirably isolated against their setting, and, had the first group been equally satisfactorily disposed, the composition would be much more pleasing. The unequal spacing of the figures is good, and, while the sunshine is scarcely concentrated enough to rank as an effect, it lends a brilliance to the presentment which is of considerable value.

No. 6, "The Porter," by S. J. Vella, strikes one as a no less promising effort, the feeling of sunlight being nicely expressed, and the figure being not only well caught but also admirably placed in the space available.

The Value of Enlargement.

The print, however, is very small, and it is questionable if, in its present scale, its attractions are as fully brought out as they would be if the print were enlarged.

As far as can be seen from the reproduction, the subject would stand a reasonable degree of magnification, although there seems to be a slight falling off towards the top. This, however, might be corrected during the operation.

Naturally, the point is one that can only be confirmed by experiment; but this is the time of year when, with the long evenings, there is ample time, and a beginning in this very fascinating method of printing may well be made.

There is no doubt that it does bring up the artistic qualities of a print, and, under present-day conditions, it is almost essential that an enlargement must be made before a subject is suitable for exhibition. A print of this size, for example, could hardly stand being placed on a wall, but there is no reason why a larger print from the same negative should not.

No. 3, "City Dawn," by F. M. Stanley, might likewise be treated with advantage, and the contrast of the chimney pots with the very fine sky would in all probability be shown to advantage.

Circumscribed Subjects.

The nearest chimney, perhaps, seems rendered on too large a scale, and a little more space above and below does seem advisable. The subject appears to call for a more distant viewpoint, for, as it stands at present, it seems restricted and circumscribed. No. 4, "King Emmanuel's Palace, Cintra," by Miss O. M. Gee, also conveys a similar impression, but it is quite likely that, in both cases, the required distance could not possibly be obtained.

In the latter the omission of the top of the tower is unfortunate, and the subject cannot be said to have received the treatment it should. The rendering does not do it justice; but if the state of affairs was as we have inferred, no other presentation would seem to be feasible unless a lens of shorter focus was available.

Such a lens would enable a greater area to be included upon the plate or film without alteration of viewpoint; but, as a general rule, it is seldom available when needed.

Had it been utilised in this case, the present suggestion of restriction would have been avoided, and the presentation would gain correspondingly. In the case of No. 1, "Waiting," by Mrs. Scawn, a like feeling exists,

but it is attributable to the placing of the little figure so near the left-hand edge and not to a too-near viewpoint.

Line of Sight.

What has happened is that the line of sight has been directed too much to the right. The degree may be only fractional, and if the camera had been pointed just a shade to the left so as to include a quarter inch more on that side and so much less on the other, the present objection would not exist.

Now, the doll being so much more in the picture, it claims, really, more attention than the child, whereas the reverse should be the case. The addition of the quarter inch suggested to the left, together with a trim of the same amount from the right, places the two figures in an opposite relationship, the child becoming the centre of interest, and the doll reverting to a properly subordinate position. This is as it should be, and, with the reversing of the relative claims upon the attention, the restriction disappears.

Possibly the effect would be still further improved if the light on the child were brighter than that on the doll. That might be arranged by either placing the latter in shadow, or, if possible, by seeing that the tone of the dresses of each was changed over, the child being made to seem the brighter.

Relative Significance.

The idea is to emphasise the child at the expense of the doll, and anything which tends to stress the significance of the first would also tend towards enabling the picture to fulfil its intention.

A somewhat analogous position arises in connection with No. 2, "Buildwas Abbey," by T. Leonard Bott; but it arises, here, from the bright lights of the sky in competition with the lesser lights on the stonework of the pillars.

It is the latter which should predominate, for it is the feeling of sunlight upon them which should provide the motive. The notes of the sky prevent this, and either the subject should be so arranged that none of the sky shows through, or what is allowed to show should be subdued in tone.

"MENTOR."

Pictorial Analysis

Every week one of the pictures reproduced on an art page will be analysed in detail for the benefit of readers of the paper who are seeking to improve their pictorial work.

"WINTER," by F. Lehner.

HERE, in this country, it is exceptional for a heavy fall of snow to occur, and, during the time it remains in its pristine purity, for sunshine to bestow its glorifying influence. It more often happens that, either there is not enough snow to cover the ground without allowing patches of grass or herbage to show through, or, if the snowfall is adequate, the sun does not appear.

Snow and Sunshine.

Parts of the country may be more fortunate than others, but, even so, it is very rare indeed for conditions to be wholly favourable, and although, as winter approaches, visions of snow pictures flash across our minds, they never seem to materialise, mainly on account of these reasons.

Still, the hope remains, but it cannot be too strongly emphasised that, without a sufficient depth of snow and a reasonable degree of brilliance in sunshine, it is practically impossible to render such subjects as they should be. Farther north, or in the more mountainous regions of the Continent, better conditions obtain; the snow lasts longer, and there is a better chance of full sunlight. That advantage has been taken of these opportunities this picture seems to show. The fall is deep and, except for a few bits here and there, the ground is entirely covered. These bits do not greatly matter, for they occur in regions where they naturally join up with other darks which have their function in the picture.

In the foreground the surface is suitably broken, and, with the cross lighting of brilliant sunshine, an exceedingly fine impression of the texture, purity and the manifold modulations of snow in sunlight and shadow is conveyed.

Tonal Modulations.

By far the major part of the attraction of the rendering lies in these

modulations. Every subtlety of tone, from light at its most brilliant to shadows of soft quality and moderate depth, seems to be recorded. The whiteness of snow in full sunshine is shown, and every minute step from that brightness to the local shadow tone is given its full value; but, if it

concentration of attraction that the unity of the picture is fully preserved. As it happens, the leading lines converge upon the same area and the importance of that region is emphasised; but, even with an arrangement that was less amenable, the attraction would still be maintained if the contraposition of lights and darks remained.

Moreover, the tree and light have a not inconsiderable strength of position which adds to their significance, and, altogether, the composition makes up very well indeed.

From the technical standpoint the print is exemplary. It is of splendid quality, and the way in which all the distinctions of tone have been rendered bears witness to the high degree of craftsmanship involved. It is evident that the exposure has been very nicely judged in the first instance, for, while all the lighter tones are recorded without loss of gradation, the shadows are also fully modulated.

Technical Treatment.

That these are so well shown, too, provides a proof that the time of development of the negative was suitably adjusted to the class of paper on which it was designed to be printed, and that the print itself received the appropriate technical treatment.

It is very well done indeed, and, while no data concerning the picture are available, it may be mentioned that, in the opinion of prominent workers in this sort of thing, it is desirable to keep the exposure on the short side—about half the meter reading usually proving adequate—development being carried on for rather more than the normal time for sunshine subjects, any tendency to excess of contrast being counteracted by the choice of a paper of the longest possible range.

"MENTOR."

be possible to conceive the same thing without sunshine, it will readily be appreciated how great the loss would be.

There would be distinctions of tone, it is true, but all the brilliance, all the diversity of tone, and all the sparkle that is characteristic of what a representation of snow should be would be lost.

The brightest light occurs to the right of the principal tree at (1). That tree, and the light combined, form the centre of interest, and the conjunction of brightest light and strongest dark in the same vicinity ensures so great a

Letters to the Editor

The Editor is not responsible for the opinions of his correspondents.

A PHOTOGRAPHIC CALENDAR.

SIR,—I notice in to-day's "A.P." you publish a letter from a Scotch gentleman who seems to be obsessed with the idea that Scotland is leading England in the photographic calendar business. He is quite wrong, for the *Manchester Guardian* publishes yearly a calendar called "The Year in Photographs," quite apart from the fact that all the best brewers, undertakers, etc., make a yearly present to their clients of really beautiful calendars, often of really lovely quality and artistic appeal.—Yours, etc., "LANCASHIRE LAD."

A NEW METHOD OF GLAZING PRINTS.

SIR,—We all know the difficulties encountered when glazing prints; how the prints will stick to the glass despite all precautions, and how finally they have to be removed with the aid of a chisel.

Here is a method that imparts a beautiful glaze, and at the same time the aforementioned chisel can be dispensed with.

The print to be glazed, which should be on glossy paper, is fixed and washed in the usual manner. Upon a sheet of clean glass lay a piece of cellophane (slightly larger than the print) having previously given it a good soaking in water. Remove the print from the final washing water, do not drain, and squeegee in contact, face down, with the cellophane.

Put aside, and when dry the print and cellophane will have adhered together securely, and the whole can then be peeled off the glass, imparting a glaze that will gladden the heart of any blockmaker.

Trimming neatly completes the operation.—Yours, etc.,
R. H. DEAL.

FIXING PRINTS.

SIR,—It is a firmly established tradition in photography, as recently evidenced in your columns, that the complete fixation of gaslight and bromide prints requires 15 to 20 minutes in the hypo. Yet Lumière and Seyewitz in 1924 showed that such a print immersed in a fresh 25 per cent hypo bath was completely fixed in 20–30 seconds. Anyone who is sceptical about this may easily test its truth by putting slips of bromide paper in hypo for different times and then treating these with dilute sodium sulphide solution. If any silver bromide remains in the paper a brown stain will appear.

Traditions, however, die hard, and I predict that twenty years from now this tradition, like "Johnny Walker," will still be going strong.

I give my prints two to three minutes in the hypo, and have had no trouble.—Yours, etc.,
C. A. SHAW
(Massachusetts.)

SPEED NUMBERS.

SIR,—In reference to the request that appears at intervals asking for a method of comparing Scheiner speeds with H. & D. numbers, I give hereunder a table which I have used with complete success for some time. I only include those speeds relating to average plates and films in common use. The advantage of this table over others that have been published is that the H. & D. speeds are given in round figures, such an are usually quoted by the makers; possibly this is not quite so exact, but it does not have the slightest effect in practice.

| SCHNEIER. | H. & D. | SCHNEIER. | H. & D. |
|-----------|---------|-----------|---------|
| 16 | 250 | 20 | 650 |
| 17 | 350 | 21 | 800 |
| 18 | 400 | 22 | 1050 |
| 19 | 500 | 23 | 1300 |

When using a plate of an H. & D. speed not quoted in the table, use the *next lower* Scheiner figure: e.g., the popular speed of 700 H. & D. would be reckoned as Scheiner 20.—Yours, etc.,
C. W. MARTIN.

D. & P.

SIR,—As a professional dealer may I make a reply to the various "grouses" that have appeared in your columns lately. It is unfortunate that your readers seem to have hit upon people who obviously do not know their business, judging from the excuses offered for the various errors made. It is also unfortunate that your readers themselves have not the incentive to "do it for themselves," thus missing half the fun of a wonderful hobby, and incidentally coming across the difficulties. As a member of a very large society, and one or two postal clubs, I may be different from other dealers in knowing exactly the requirements of the more advanced amateur. To that end I have always given personal service rather than adopt mass processing methods, both for my more serious workers and "button pressers."

There is no need for a separate service for both, as Mr. Lewis suggests. The button presser, with his picture of "Tommy in the garden complete with washing and dustbin" is entitled to as much consideration as anybody else. It is no novelty to meet the man who has "done photography for years" but doesn't want the bother of rigging up his dark-room, and can get work done for a song at Messrs. Cutprice. Mr. Reeves in your October 10th number complains of the lack of individual attention. This, of course, depends upon the dealer concerned and his method of calculating whether a transaction "pays." Personally, I find individual attention "pays," though possibly not as much in hard cash as Mr. Reeves' dealer would wish. One makes allowances for a hobby. To others I suggest joining their local society, or if that is not possible a postal club. There is usually a professional man who is enthusiastic enough, like myself, to help. And don't forget to continue to read "The A.P."—Yours, etc.,
G. E. OAKLEY.

NOTCHING OF CUT FILMS.

SIR,—Users of present-day cut films are familiar with the notches in the top right-hand corner when facing the sensitive side. They are intended to indicate by the sense of touch which is the sensitive side, but I am inclined to think they might well be omitted.

These notches seem to have been introduced many years ago when the manufacture of films was by no means what it is to-day. At that time anti-halo films were unknown, and the packing of all kinds of film was nothing like so perfect as it is now.

Although I fill my slides in complete darkness with S.R. pan. films, I never have occasion to feel for the notches. The fact that all films are packed face downwards is quite sufficient in itself to prevent errors in filling. A further safeguard is that the films usually curve with the sensitive side inwards, and finally that the insensitive side of an anti-halo film is distinctly glossy as compared with the front.

On the other hand, a very definite disadvantage of these notches lies in the fact that they are stamped out by a die in process of manufacture, leaving a celluloid burr on the underneath side. This burr does not matter very much if the films are kept absolutely apart until they are fixed, washed and dried. If, however, a few films are washed together in a basin and allowed to slide one over another some heartrending cuts in the gelatine are certain to occur.

Whenever I have a few films to be completed in a hurry, I always snip off the notched corners of the rebate before proceeding to hand wash them. This prevents subsequent damage to the gelatine.

As notching of cut films appears to be an anachronism, comparatively useless, and in some circumstances harmful, the suggestion is offered to the leading manufacturers that notching might be altogether omitted, with a corresponding economy in their prime costs.—Yours, etc.,
W. McWILLIAM.

American Pictures at the *Royal Photographic Society*

DURING this month an exhibition of unusual interest is open at the house of the R.P.S. (35, Russell Square) from 10 to 5 daily, except Sundays. Admission is free.

We describe the show as one of unusual interest for two reasons: first, because of the variety and excellence of the exhibits themselves; and, secondly, because the method of organisation was decidedly original. The idea was to bring together a collection of prints representative of American pictorialists, and the success of the effort is decided and indisputable.

Clearly the task was not only difficult but delicate; and great credit is due to the energy and tact of Mr. Joseph M. Bing, of the New York C.C., and to those who so enthusiastically co-operated with him.

First of all, the Smithsonian Institution, the four leading photographic magazines of America, and sixteen photographic clubs, were each asked to select and contribute one print which they considered a typical speci-

men of the best American work. Next, 134 individual photographers were asked to contribute one print each, the choice resting with themselves. The result is the 155 prints now on view, and a very fine collection they make.

In a few instances it is a little difficult to account for the choice; and curiously enough this applies particularly to some of the prints selected by the magazines and clubs, although they must have had an immense number of prints to draw upon. Further, some of the individual contributors have selected prints that have already been shown in this country, and in some cases recently. But it can safely be said that of the 155 prints there is not one which is unworthy of its place even in such choice and distinguished company.

The collection cannot be described; it must be seen. It would be not only invidious but misleading to select prints for individual mention in such a brief note as this. To those

who are unfortunate enough not to be able to see the collection we may say that some of the exhibits are reproduced in the current "Photographic Journal," and Mr. J. Dudley Johnston describes the exhibition in a most able and interesting manner. We hope to reproduce several of the pictures in an early issue of "The A.P."

Naturally, the technical quality of the exhibits is of the highest possible order, and it is significant to note the processes employed by such distinguished workers. Bromide and chlorobromide account for no fewer than 127, and bromoil in all forms for 17, leaving only 11 for all other processes.

In connection with this collection there is a significant fact that must not be forgotten. On its return to America the collection will go on tour, and its first appearance will be at the National Academy of Design at New York. As this practically corresponds to our own Royal Academy of Art, we are surely given food for thought. Will the portals of Burlington House some day open for the entrance of pictorial photographs?

NEWS AND REVIEWS

ITEMS OF GENERAL INTEREST FROM ALL QUARTERS.

Will readers please note that our issue dated December 26th will be on sale on Monday, December 24th.

Those who go to see the exhibition of American Photography at the Royal Photographic Society's House, 35, Russell Square, should on no account miss Mr. Pollard Crowther's one-man show of stage photographs, on the ground floor. Even after seeing the best work America can show us we must warmly admire such pictures as these, and compliment their author on his genius. They are all in the "grand" style, both in regard to size and treatment, and are magnificent examples of what really can be done in theatrical photography. They are far in advance of the "usual thing," and by the use of the new Gevaluxe paper for certain selected subjects they have all the quality of rich mezzotints.

Pittsburgh's Annual International Photographic Salon for the Year 1935 will be hung in the Carnegie Institute, Pittsburgh, Pa., U.S.A., March 15th to April 14th, 1935. Messrs. A. Aubrey Bodine of Baltimore, Md., Frank R. Fraprie of Boston, Mass., and Dr. D. J. Ruzicka of New York City, will be the

jury for selection. The last date for receiving prints from United States and Canada will be February 16th. From all other countries the prints should be mailed in time to reach Pittsburgh by February 9th. Entry forms, containing full details, are obtainable from C. E. Leshner, Secretary, The Pittsburgh Salon of Photographic Art, Oliver Building, Pittsburgh, Pa.

The Annual Exhibition of the Photographic Society of Ireland was held in the Dawson Hall, 42, Dawson Street, Dublin, from November 26th to December 1st, inclusive. There were four sections and over 400 prints were sent in, the largest being the Pictorial Section, in which the number was 285. The judges (Mr. G. Atkinson, Mr. J. White and Miss Ball) commented on the improvement in the quality of the work compared with that of last year. The exhibition was formally opened by the Lord Mayor of Dublin, Alderman Alfred Byrne, T.D., who also kindly presented the medals to the successful competitors. Great interest was shown in the exhibition by the general public, and a considerable number of new members was enrolled.

Stolen Camera.—A reader, Mr. R. A. Atkinson, informs us that he has had his camera stolen. It is a Leica, Model 1, f/3.5 Elmar lens No. 69974. Should any reader or dealer hear of this instrument will he inform the Walton Street Police Station, S.W.7, or communicate with the owner at Lacy Green, Coulsdon, Surrey?

The Prizewinners in Johnson's "Holiday" Competition have been announced. These were: First Five Prizes of £5 each awarded to: Mr. T. F. Holdsworth (Wakefield), Mr. Llew E. Morgan (Swansea), Mr. C. L. Brown (Manchester), Mr. G. V. Child (Halifax, Yorks), Mrs. W. N. Jameson (Birmingham). Five Second Prizes of £2 each awarded to: Mr. H. Garside (Goole, Yorks), Mr. Roger Carter (Carcavelos, Portugal), Mr. F. Hall (Rugby), Mr. Albert Wallis, (Nottingham), Mr. F. de Parades (Folkestone). Ten Third Prizes of £1 each awarded to: Mr. J. H. Leighton (Bradford), Mr. H. W. Hillier (Maidstone), Mr. D. J. Campbell (Swansea), Mr. A. B. Pinks (Hove), Miss E. G. Raines (Bristol, 6), Mr. M. G. Parker (Bolton), Mr. G. E. Backhouse (Leeds, 8), Mr. R. Moore (Barkingside), Mr. I. B. M. Lomas (Wealdstone, Middlesex), Mr. J. W. Christian (Castle Eden). There were also 84 smaller prizes. The complete list is obtainable from Messrs. Johnson & Sons, Hendon Way, Hendon, who will also supply particulars of their "Flashlight" Competition.

Amateur Cinematography

NEWS, NOTES AND MATTERS OF INTEREST FOR ALL CINEMATOGRAPHERS USING AMATEUR CINÉ APPARATUS.

Your Christmas News Reel By M. A. LOVELL-BURGESS.

I HOPE you have begun to make your Christmas news reel. You make it, of course, as you do a diary, bit by bit, beginning with the first, freckled, lone carol-singer, who has one eye on the bell and the other on the policeman, to the full-blown Christmas carol party loudly exhorting all Christians to awake and likewise to hark.

This Christmas news reel will give you an opportunity to introduce any subtle touches in characterisation, cutting and direction generally, that you may have acquired from a careful study of 1934 films, amateur and professional.

There will have to be a shot of mother going shopping, of father brooding over a Christmas present list, of sister packing the surprise parcel for the youngest member of the family, the making of paper decorations in the nursery, the picture of baby brother writing a long and laborious letter to Father Christmas. Remember all these are before-Christmas scenes and can be taken and developed in the course of the next few days.

Get hold of a heavily-laden but patient postman, and in the editing of your film let him dissolve into a similarly laden Father Christmas. The older ones will see the joke.

Hang round your nearest church when bell-ringing practice is in progress until you get an invitation to film the bell-ringers at their work. There is usually one ancient bell-ringer who deserves a close-up all to himself. And it is a splendid opportunity, when you come to show the film, to work off the gramophone record of church bells.

I dare not suggest moonlight—as it happens, it's going to be a dark Christmas this year—or snow, but if snow *should* come, be ready for it.

There will be the decorating of the Christmas Tree—get the one-year-old holding a solitary lit candle and looking pensively down at its golden glow; the stirring of the pudding by every member of the family (this can be easily staged long after the actual

puddings are made); the bringing in of the holly and the mistletoe—the mistletoe by all means if there's a pretty girl in the party; the decorating of the rooms. But don't try and work off the father, ladder, hammer and thumb gag. It's in need of a rest.

Make your film as festive as you can. Introduce colour, if you like. Include a glimpse of the brightly-lit shops, the crowds, a rehearsal of a Christmas play. Everybody presents Christmas plays nowadays, from school-children to members of the Mothers' Union.

Impose your titles on a gay background; balloons waving, children pulling crackers, a close-up of a particularly sentimental motto.

Say it with pets, if you have any in your family. A couple of dogs

pulling at an imitation cracker (perhaps you could tuck a bone inside) would raise a laugh. Tie the pup up with ribbon and suggest him as a Christmas gift. Have the cat making the Christmas pudding, well in the basin, with a touch of flour on his black brow.

Don't be shy of introducing a more serious side and mixing it all up together; Christmas is like that. Take a picture of the Crib in the church. The Crib will be there a good week before Christmas. Emphasise the spirit of Christmas by a shot of someone giving to a beggar in the street. Get a last-minute picture of the church chancel bright with holly and flowers, or of a choir practising the Christmas anthem.

If it is too late for you to make a

An unusual action subject for the amateur cinematographer can be attempted at the present time by obtaining permission to film the crowd of shoppers from inside the window of a popular shop or store. This is best done in the late afternoon when all lights are full on to illuminate the faces. Keep the camera concealed to avoid the crowd staring at it. Fastest pan. film should be used, of course.

disc recording, synchronise the carol-singers—the party, and not the lone and early pirate—with a Christmas carol gramophone record.

Finally, show your Christmas news reel on Christmas night, at that precise moment between boredom and sentiment when the gaiety is beginning to flag. Like the one who has completed a postal course in music, you will be able to say, "When I began, a hush fell upon the room."

"Come-and-be-Shot" Party.

The fun of this sort of film is that you can add to it. Make the Christmas party a "come-and-be-shot" party. Indoor cinematography presents few difficulties these days to the intelligent amateur.

Film the party round the candle-lit dinner-table. Get the teller of the ghost story in sinister shadow. immortalise the start that Aunt Mabel

gave when, at the most harrowing moment, the chestnut popped. Aunt Mabel won't mind. It will take a good deal of rehearsing, of course, but rehearsing is half the fun. And don't forget to include the toast to absent friends, and that moment when the family, united once again, sing a carol together or join hands in Auld Lang Syne.

Compère your own show this Christmas.

Avoiding Trouble at the Christmas Show

By PETER COLLIN.

MANY fortunate people owning home cinema projectors are now in the midst of preparing for the special shows it is customary to give during the Christmas festivities. In order that they may be able to be prepared for trouble and be in a fit state to cope with it when and if it arrives, the following few hints have been compiled.

The Projector.

First of all the projector. Go over the machine carefully and oil it according to the instructions issued by the manufacturers, cleaning dirty parts and tightening loose nuts and screws. Make sure everything is in good running order, especially the take-up mechanism, which is a most likely source of trouble. On Pathéscope projectors the little take-up "brake" sometimes needs replacing, as it wears out after a time and requires a new rubber.

Study carefully all electrical connections and see that they are sound and not likely to cause a fuse. If they look suspicious it will be found much better to make new connections rather than patch up old ones with insulated tape. The resistances particularly should be open to inspection, as the heat generated is sometimes the cause of destroying the insulations and blowing a fuse.

The projector motor should also be inspected, making an especial point of seeing that the brushes are not worn out and that they are making contact satisfactorily. It is most necessary to have the projector handle within reach during a show. Often this detail is omitted, but it will safeguard the operator against a complete breakdown if the motor fails.

A small wire-hair brush will also be found very handy to clean the projector gate of dirt and fluff at the end of each reel, which will diminish considerably the wear and tear on the films. It is not the process of running films through the projector which causes scratches and lines, so much as dirt in the gate, and especially grit, which cuts its way into the emulsion whilst the film passes through.

Clean the lenses and the reflector as well as the bulb of the projector. A

silk handkerchief is best for this job, or, if you want to make a real thorough business of it there are various lens-cleaning outfits on the market which are very effective. If you take the lenses out of their cases and dismantle them, be very careful to put them back exactly as they were, or the optical system will be thrown out of line.

Always have at least one spare projector bulb close at hand. Then, if one burns out during a show, a replacement can be made quickly and without unnecessary delay. It is much wiser not to overload the bulb, as it will shorten its life and only give off a great deal of heat instead of extra light.

Spools.

A universal and consistent cause of trouble with projection is due to bent and faulty spools. They jam the film, both on the top and bottom spool arms, causing a great deal of strain on the sprockets, often delaying the take-up and thus bringing about a breakdown. The only thing to do is to take great care with the reels, keeping them if possible in tins when not in use, and carefully straightening them out when bent. If they become too bad it is best to buy new ones.

Broken Films.

The question of what is the quickest and most effective method of dealing with a break in the film during a show is something which is often heatedly debated. To my mind it resolves itself as follows: If the film breaks underneath the gate—that is, when it has passed through the gate—it is best during an important performance to run the film into a basket underneath. The main point to bear in mind is that "The Show Must Go On" if it is humanly possible, and although this process is hardly legitimate, I consider it is warranted under these circumstances providing the projectionist is prepared for it with a safe and clean basket and that he rewinds the film carefully afterwards. He must also use his own judgment to decide if it is worth stopping or not, according to the size of the reel of film left to run through and the importance of the occasion.

When the film breaks on the upper

side of the gate, however, nothing can be done except to stop. In this case it is obviously wisest to join up and proceed. Some people do not make any sort of join, but wind the film round on the bottom spool until it catches, but this is unsatisfactory, as it is a tedious process and painfully slow. Others make a proper join with cement. While this is the most sure way it is again a very slow process when time is precious, and to the waiting audience a few seconds seem like several minutes.

A method which if used with a reasonable amount of care gives both speed and safety, is to use ordinary paper clips of the smooth variety and to clip the ends together. One turn of the bottom spool is then given and the show can proceed. With practice this can be accomplished in very few seconds. In fact it is a good plan to practise this method of joining several times beforehand so that it can be accomplished without fumbling when the occasion arises.

Rehearsal.

All the programme should be tested before the show either by running the films through the projector and/or running them through your fingers. For this hold the film between your thumb and first finger and rewind slowly. Any bad joins will come apart under this pressure, and bad places in the film can likewise be felt and inspected.

On winding the films back again so that they are the right way round, a further process may be attempted, if desired, of cleaning. This will prevent fluff and dirt marring the picture during projection. For this use a soft piece of cloth, and, if possible, a suitable oil remover such as chloroform or carbon tetrachloride.

Finally, the big secret of avoiding breakdowns is undoubtedly careful and unhurried preparation. This must not be left to the last minute, otherwise something is bound to be overlooked or forgotten. If a breakdown does occur do not be flustered or hurried. Do not be worried by the audience and the many turned and anxiously peering faces! Set about the difficulty with a calm confidence and find the source of the trouble by systematic elimination.

December 19th, 1934

News and Reviews—(contd.)

At a Meeting of the Royal Photographic Society on December 10th the following Associates were admitted to the Fellowship: Daisy Edis (Durham), T. Dobson (Bolton, Lancashire), Eric J. Hosking (London), S. Ichigo (Japan), H. B. T. Stanton (London), Will Till (Johannesburg), J. D. Toloff (Illinois, U.S.A.), J. N. Unwalla (Bombay, India).

The following members were admitted to the Associateship: D. J. T. Bagnall (Yorkshire), James Black (S. Africa), H. N. Blinkhorn (Oxford), P. H. Braithwaite (Sussex), Edwin Broomer (Devon), F. W. Bond (London), H. E. Bush (Cambridge), B. F. C. Chambers (Twickenham), Margaret E. Chilton (London), William H. Cox (Luton), Edward Philip Davey (Middlesex), Alfred Ivor Fairbank (Kent), William J. Foster (Bristol), Ray W. Goodrich (Carolina, U.S.A.), John J. Grover (Rotherham), H. L. Hague (Lancs), Richard N. Haile

(Bognor Regis), Archibald G. Handford (Croydon), R. Aytoun Henderson (Scotland), Nancy W. Huggins (London), F. G. James (London), Alfred Jones (Coventry), Frederick R. J. Jones (London), John Keane (Croydon), A. V. Kenah (Devon), S. J. Khambata (Bombay), Paul Kimberley (London), E. Roy King (London), R. E. de Klerk (N. Rhodesia), W. D. Le Sage (Virginia, U.S.A.), Ivor B. M. Lomas (Middlesex), Amy Milner (London), Mahmoud A. Melouk (Egypt), Beaumont Newhall (Mass., U.S.A.), P. M. Phanse (Poona, India), Thomas Trevor Potts (Lancs.), E. S. Richards-Everett (London), George P. Symes Scutt (Sussex), C. S. Semmens (Herts), George A. Slight (London), William Clifford Squires (Cambridge), S. Y. Tong (Cambridge), Frederick W. Thiel (Queensland, Australia), Mary D. Turner (Sheffield).

The Federation of Civil Service Photographic Societies has arranged to rent the Foyle Gallery, Charing Cross

Road, W.C.2, for the entire month of March next for its Tenth Annual Exhibition, comprising a representative selection of pictorial and scientific photography. Civil Service Photographers who do not belong to any of the Federated organisations are invited to apply for entry forms (enclosing stamped addressed envelope and stating department) to Mr. F. M. Chapman, Ministry of Labour, Whitehall, S.W.1.

The Brondesbury Ciné Society has had a busy month, and as a result its present film, "Two Candles," has reached the editing bench; they hope to give its first presentation early in the New Year. This Society has made some changes in its financial arrangements, the entrance fee of two guineas having been abolished, and the subscription is two guineas a year for ladies and gentlemen; while with regard to film used, it has been agreed that the cost shall be shared equally by all those taking part in the production.

The Week's Meetings

Societies will have their meetings announced here if the syllabus is sent to us at the beginning of the session or from time to time.

Wednesday, December 19th.

Borough Poly. P.S. Discussion on the Exhibition.
Camberwell C.C. Lantern Reflections 1933-34. R. C. L. Herdson.
Chorley P.S. "The Amateur Photographer" Prize Slides.
Coventry P.C. Summer Outings—Print Exhibition.
Croydon C.C. "Miniature Cameras." F. Hunnissett.
Darwen P.A. One-man Show.
Dennistoun A.P.A. "Perfect Enlargements." D. Phillips.
Edinburgh P.S. "Nigeria." H. D. Wyllie.
G.E. Mechanics Inst. P.C. Developing and Printing. Johnson & Sons, Ltd.
Ilford P.S. President's Evening.
L.M.S. (London) P.S. Carbo. Autotype Co., Ltd.
Northallerton and D.P.S. Trimming Prints, etc. R. P. Haw.
Partick C.C. Gaslight Printing. D. A. M'Vean.
Phoenix Welfare C.C. Annual Exhibition Judging and Criticism.
Rochdale P.S. Filters. J. Hargreaves.
South Essex C.C. "Printing on Gevaluxe Paper." R. S. Beck.
South London P.S. Ciné Group Meeting.
South Suburban and C.P.S. "The Lecturer, Lecture, and LECTURED to." A. L. Fairbank.
Stockport P.S. Flashlight. A. E. Tinker.
Whitehall Ciné Society. "To Greece by Car with a Motocamera." C. L. Smith.

Thursday, December 20th.

Accrington C.C. "Bird Hunting with the Tramp." R. Woods.
Aston P.S. M.C.P.F. Portfolio and Slides.
Burton-on-Trent C.C. "Why a Telephoto Lens?" Mrs. N. Ashmore.
Bury P.S. Enlarging for Beginners. H. Senior.

Thursday, December 20th (contd.).

Exhibitions and Competitions

CURRENT AND FUTURE.

Notices of forthcoming exhibitions and competitions will be included here every week if particulars are sent by the responsible organisers.

The Amateur Photographer Monthly Competitions for Beginners, Intermediate and Advanced Workers.—Entries, December 31. Rules in the issue of November 28.

Chicago International Salon.—Open, December 13-January 20. Chicago Camera Club, 137, N. Wabash Avenue, Chicago, Ill., U.S.A.

"Northern" Exhibition, City Art Gallery, Manchester.—Open, December 8-January 19. Secretary, J. Chapman, 25, Radstock Road, Stretford, Manchester.

8th International Christmas Salon of Photography, Antwerp, 1934-35.—Open, December 23, 1934-January 7, 1935. Particulars from Mr. J. Van Dyck, Secretary of the Fotografische Kring "Iris," Ballaerstr., 69, Antwerp, Belgium.

Madrid International Salon.—Secretary, Sociedad Fotográfica de Madrid, Calle del Principe, 16, Madrid, Spain.

Preston Scientific Society (Photographic Section). Open Exhibition.—Entry forms due January 11; exhibits, January 17; open, January 28-February 16. Secretary, F. Wells, 65, Powis Road, Ashton, Preston, Lancs.

International Miniature Camera Exhibition, for prints and enlargements made from miniature camera negatives.—February 1-21, 1935. Latest date for entries, January 21. Entry forms and particulars from Exhibition Secretary, British Photographic Fellowship, 7, Aberdeen Mansions, Kenton Street, W.C.1.

South London P.S. Annual Exhibition.—Entries, January 22; open, February 16-March 16. Details and entry forms from Hon. Exhibition Secretary, H. S. Adams, 40, Stockwell Park Road, S.W.9.

Leicester and Leicestershire Photographic Society International Exhibition.—Open, February 25-March 2, inclusive. Particulars and entry forms from the Hon. Organising Secretary, W. N. Plant, 30, Harrow Road, Leicester.

Ilford P.S. Annual Exhibition.—Entries, February 2; open, March 4-9. Hon. Exhibition Secretary, H. G. Haylock, 58, Windermere Gardens, Redbridge Lane, Ilford, Essex.

Birmingham P.S. Annual Exhibition.—Entry forms due, February 9; exhibits, February 12; open, March 2-16. Secretary, E. H. Bellamy, Waterloo House, 20, Waterloo Street, Birmingham.

City of London and Cripplegate P.S. Annual Exhibition.—Closing date, February 11; open, March 11-16. Exhibition Secretary, J. R. P. Hilliard, 86, Downton Avenue, Streatham Hill, S.W.2.

L.M.S. Annual Exhibition.—Entries, February 13; open, March 11-16. Secretary, A. J. Scrivener, Station Master's Office, Euston Station, N.W.1.

Cannes Photo-Club International Salon.—Entries, February 20; open, March 31-April 7. Entry forms from Secretary, Photo-Club of Cannes, Boite Postale 105, Cannes, France.

G.E. Mechanics Institute P.S. Annual Exhibition.—Entry forms due, February 22; exhibits, March 1; open, March 12-13. Hon. Exhibition Secretary, W. F. Calcraft, 76, Gurney Road, Stratford, E.15.

Barry C.C. International Salon.—Entries, March 8; open, March 18-23. Secretary, J. H. White, Caerleon, 61, Pontypridd Road, Barry, Glam.

Scottish National Salon (Art Galleries, Ayr).—Entries, Overseas, March 9; Great Britain, March 23; open, April 20-May 4. Secretary, Arthur J. Nelson, 6, Hilary Crescent, Ayr, Scotland.

Bolton C.C. International Exhibition.—Entry forms due, March 11; exhibits, March 18; open, April 6-13. Hon. Secretaries, T. Dobson and T. Trevor Potts, c/o C. E. Willis, Ltd., 87, Bradshawgate, Bolton, Lancs.

Brussels International Salon.—Entries, March 15; open, May 7-June 9. Secretary, M. Maurice Broquet, Rue du Sceptre, 77, Brussels, Belgium.

Antwerp International Salon.—Entries, March 15; open, April 27-May 12. Secretary, D. J. de Groote, Van Heystrelt-Straat, 19, Deurne-Antwerp, Belgium.

Hackney P.S. Annual Exhibition.—Entries, March 25; open, March 27-30. Secretary, Walter Selfe, 24, Pembury Road, Clapton, E.5.

Nottingham and Notts P.S. International Exhibition.—Entry forms due, March 27; exhibits, April 3; open, April 11-13. Entry forms from W. R. Anderson, 3, Meadow Road, Beeston, Notts.

Readers' Questions ANSWERED

GENERAL.—All communications for the Editor should be addressed: "The Editor, *The Amateur Photographer and Cinematographer*, Dorset House, Stamford Street, London, S.E.1," and in every case, without exception, must give the name and address of the writer.

CONTRIBUTIONS.—The Editor is glad to consider original, up-to-date manuscripts on photographic subjects. All contributions must be typewritten, or in very legible handwriting on one side of the paper only. Letters or communications arising out of matters already appearing in the paper are not paid for. The Editor disclaims legal responsibility for the safety of matter submitted to him, but he will endeavour to return rejected manuscripts, etc., when a stamped addressed envelope is enclosed. MSS. or prints that are not actually accompanied by a stamped wrapper or envelope can in no case be returned. Reproduction fees for prints are only paid by arrangement beforehand. The sending of a print, without any condition stated, will be taken as permission to reproduce it without fee.

ENQUIRIES AND CRITICISM.—Advice, Criticism and Information are freely given, but the following conditions should be read carefully before applying, as any communication which does not comply with the rules must be ignored.

(1) See "General" above. (2) Every question and every print for criticism must be sent separately through the post, and must be accompanied by a separate stamped addressed envelope. No exception can be made in any case to this rule, except so far as enquiries or prints from Overseas are concerned. (3) Neither enquiries nor prints for criticism must be enclosed with competition prints. (4) On the back of each print sent for criticism, in addition to the name and address of the sender, must be the title (if any), and the criticism coupon from the current issue. (5) Enquiries should be clearly written, on one side of the paper only, and should be specific and not general. Such enquiries as "How can I take interiors?" or "Can you give me some hints on outdoor portraiture?" are too general to be dealt with in this section. (6) All envelopes should be distinctly marked "Query" or "Criticism," as the case may be. (7) Prints are sent for advice or criticism on the distinct understanding that by so doing permission is given for their reproduction without fee. We endeavour to deal promptly with enquiries, but cannot undertake to answer by return of post, nor can we give precedence to any enquiry.

A selection of those replies is printed each week, but all questions are answered by post. Enquiries from abroad must contain a coupon also, but it need not be from the current number, and should be cut from the latest issue to reach the enquirer.

Magnesium Powder.

I have a quantity of magnesium powder. How can I prepare it for flashlight purposes?

J. H. K. (Kierriemuir.)

We are always reluctant to give information as to the preparation of flashlight powders, as the process is attended with considerable danger, except in very skilled hands. The magnesium powder must be very fine in character, and you should mix two parts with one part of potassium perchlorate. The two powders must be mixed with a piece of card or a feather, as anything in the way of friction may cause an explosion.

Time and Temperature.

Will you give me a formula for tank development together with a time and temperature table?

R. D. (Bodiam.)

We dealt with the question of time and temperature tables in the Beginners' section of our issue for December 5th, and if you study that it will give you some information, and, at the same time, show you what a difficult question yours is to answer satisfactorily.

Parts.

With a two-solution developer the instructions are to take 1 part A, 1 part B, and 2 parts water. What is meant in this case by a "part"?

J. B. (Truro.)

It is no definite quantity. The three amounts might be, for example, $\frac{1}{2}$ oz., $\frac{1}{2}$ oz., 1 oz., which would give you only 2 oz. of solution altogether. If you wanted three times as much the "parts" would be $1\frac{1}{2}$ oz., $1\frac{1}{2}$ oz., 3 oz. So you see that you can decide on any quantity for a "part" that suits your requirements. Whatever quantity you select it holds good, of course, for the three constituents. The strength would be the same, even if you took 1 part, 1 part, 2 parts, it is only the quantity or volume that varies.

Checking Scale.

I have reason to believe that the focussing scale on my camera is inaccurate. How can I check it?

H. L. B. (Runcorn.)

The simplest way of checking your scale is to set the pointer to a particular distance on the focussing scale and photograph an object at exactly that distance from the lens. If you do this with the markings at the beginning and end of the scale and one in the middle this will be quite sufficient.

Developing Films.

Do you recommend tank development instead of dish development for roll films? Is the former suitable for panchromatic films?

R. S. (Huddersfield.)

With dish development of roll films there is always a risk of what is known as aerial fog, due to the exposure of the film to air during the greater part of the process. Tank development is certainly preferable in the case of panchromatic material, as there is also no risk of exposure to light.

Persulphate.

Will you give me the formula for the ammonium persulphate reducer?

N. L. Y. (Leeds.)

The following solution, which differs from the usual one, was recommended some years ago by H. W. Bennett:

| | |
|-------------------------|---------|
| Ammonium persulphate .. | 1 oz. |
| Sodium sulphite .. | 2 oz. |
| Sulphuric acid .. | 50 min. |
| Water to .. | 10 oz. |

One part of this is diluted with nine parts of water, and enough applied to cover the negative. The dish is gently rocked. After a time the solution shows a milky appearance, and it should then be poured off and a fresh quantity used if sufficient reduction has not taken place. The operation should be stopped a little short of the required reduction, as there is a continuing action during the subsequent washing, which should be thorough.

Mercury Bleacher.

How is the mercury bleach for sulphide toning prepared?

D. A. (London.)

Dissolve 1 oz. of mercury bichloride in 16 oz. of hot water, and allow to cool and settle. Decant the clear liquid, and add 30 minims of hydrochloric acid. The print must be quite free from hypo, and must be thoroughly washed after bleaching, before applying the sulphide.

Duplicating Negative.

I have a thin negative, full of detail, which I wish to retain as it is. I require a much stronger version of it. Is there any way by which I can produce one?

E. M. C. (Cork.)

It can be done quite satisfactorily, although you may have to make several attempts before you get just what you want. Make a positive transparency on a slow ordinary plate, just as a contact lantern slide is made. From the positive make a negative, in the same way, on a similar plate. By adjusting exposure and development in each case you can secure just the strength and contrast desired.

Tones.

When the tones of prints are referred to does it mean the gradations of light and dark, or the colour of the image?

S. S. A. (Brixton.)

The word "tone" (singular) is often used as a synonym for colour. Thus we may say that a print has a brown tone, a blue tone, and so on; or that the tone is warm or cold. We also say that we tone a print by altering its colour. The word "tones" (plural) is used to indicate the gradations of the image from light to dark, irrespective of the actual colour of the print.

Prints for Reference.

In connection with an index for negatives I wish to make a print from each one for reference. What is the cheapest way of producing them?

A. E. (Walsall.)

We cannot think of any cheaper material than bromide or gaslight paper, which need not be of the best quality. As a further economy it would generally answer the purpose to show only half the subject, or to use a size of paper smaller than the negative, e.g., $3\frac{1}{2} \times 2\frac{1}{2}$ for $\frac{1}{4}$ -plate.

Time of Fixing.

After developing and rinsing, how long should prints be left in the fixing solution?

C. B. (Lewisham.)

With a normal fresh bath and a temperature of not less than 60 degrees Fahr., approximate times are: gaslight, 5 minutes; chloro-bromide, 5-10 minutes; bromide, 10-15 minutes.

Matt Marks on Film.

What is the cause of the matt marks on the plain side of the enclosed films? How can they be removed?

D. G. S. (Sevenoaks.)

The marks on your negatives are caused by contact between the back of the negative and the paper, and, with a negative as thin as the one you send, these marks will show in printing. The only satisfactory remedy we have so far been able to discover is to lay the dry negative face down on a sheet of glass and polish up the upper surface with a piece of rag and Baskett's Reducer.

MALLINSON'S FREE-LANCING SERVICES

The year 1934 was a record one for Mallinson's Services. Over 600 Prizes were won by Members, including most of the Firsts and Seconds, and a great record was made in reproduction fees. In the 'Work' Competition run by the *News Chronicle*, Mallinson's had 5 winners in the first 13, including 2nd and 4th, though there were 50,000 entries; and they won 46 substantial Prizes, including 4 Firsts of £50, in the *Daily Mail* Competition.

This snap alone yielded a handsome profit to the Member after paying his inclusive fee for the year's work. Ensure yourself a happy photographic year by joining Mallinson's at once, and write to-day, without obligation, for references and Prospectus, to:

MALLINSON'S FREE-LANCING SERVICES

Wheeler & Co., Bombay, Allahabad and Calcutta. **CANADA:** Imperial News Co., Toronto, Winnipeg and Vancouver; Benjamin News Co., Montreal; Gordon & Gotch, Ltd., Toronto. **SOUTH AFRICA:** Central News Agency, Ltd.

Displayed Advertisements

Communications on Advertisement matters should be addressed: The Advertisement Manager, "The Amateur Photographer and Cinematographer," Dorset House, Stamford Street, London, S.E.1. Copy for displayed advertisements for the issue of any particular week must reach Dorset House by the first post on Tuesday morning in the week previous. Rates and conditions will be sent upon application.

Prepaid Advertisements

SALE AND EXCHANGE: AMATEURS ONLY—
 12 words or less 1/-
 1d. for every additional word.
PROFESSIONAL AND TRADE:—
 12 words or less 2/6
 2d. for every additional word.
 Each paragraph is charged separately.

SERIES DISCOUNTS are allowed to Trade Advertisers as follows on orders for consecutive insertions, provided a contract is placed in advance, and in the absence of fresh instructions the entire "copy" is repeated from the previous issue: 13 consecutive insertions, 5%; 26 consecutive, 10%; 52 consecutive, 15%.
 All advertisements inserted in these columns must be strictly prepaid and posted to arrive at the Head Office, Dorset House, Stamford Street, S.E.1, not later than first post FRIDAY for the following week's issue, or one day earlier at the Branch Offices, 19, Herford Street, Coventry; Guildhall Buildings, Navigation Street, Birmingham, 2; 260, Deansgate, Manchester, 3; 26, Renfield Street, Glasgow, C.2.

Advertisements are inserted, as far as possible, in the order received, and those received too late for one issue, or crowded out, are published in the first following in which there is space. The Proprietors retain the right to refuse or withdraw advertisements at their discretion.

Postal Orders sent in payment for Advertisements should be made payable to **ILLIFFE AND SONS LTD.**, and crossed

& Co.

Notes being untraceable if lost in transit should not be sent as remittances.

The Proprietors are not responsible for clerical or printer's errors, although every care is taken to avoid mistakes.

BOX NUMBERS.—For the convenience of advertisers, letters may be addressed to numbers at the office of this paper. When this is desired, the sum of 6d. to defray the cost of registration and to cover postage on replies must be added to the advertisement charges, which must include the words: "Box 000, c/o 'The Amateur Photographer'." Replies should be addressed: "Box 000, c/o 'The Amateur Photographer,' Dorset House, Stamford Street, London, S.E.1." and these letters will be simply forwarded by us to the advertiser. It must be understood that we do not deal with the correspondence in any other way, nor accept any responsibility in connection with the advertisement. Readers who reply to Box No. advertisements are warned against sending remittances through the post except in registered envelopes. In all such cases the use of the "Deposit System" is recommended.

Special Note

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post. When sending remittances direct to an advertiser, stamp for return should also be included for use in the event of the application proving unsuccessful.

Deposit System

Readers who hesitate to send money to advertisers in these columns may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Amateur Photographer and Cinematographer," both parties are advised of its receipt. The time allowed for decision is three days, counting from receipt of goods, after which period, if buyer decides not to retain goods, they must be returned to sender. If a sale is effected, buyer instructs us to remit amount to seller, but in the event of no sale, and subject to there being no different arrangement between buyer and seller, each pays carriage one way. The seller takes the risk of loss or damage in transit, for which we take no responsibility. For all transactions up to £10 a deposit fee of 1/- is charged; on transactions over £10 and under £50 the fee is 2/6; over £50 and under £75, 5/-; over £75 and under £100, 7/6; and on all transactions over £100, one-half per cent. All deposit matters are dealt with at Dorset House, Stamford Street, London, S.E.1, and cheques and money orders should be made payable to Illiffe and Sons Ltd.

IMPORTANT NOTICE

Owing to the Christmas Holidays, the next issue of "THE AMATEUR PHOTOGRAPHER" (dated December 26th) must be closed for press earlier than usual.

In accordance with the notice that appeared last week, the latest date upon which MISCELLANEOUS ADVERTISEMENTS could be accepted for the above issue was

FIRST POST, WEDNESDAY, DECEMBER 19th.

WARNING

We have received many complaints from our readers in regard to the business methods of Mr. R. L. Green, trading as R. L. Green's Photographic Exchange, of 218, Fore Street, Edmonton, London, N.18.

For some considerable time we have refused to insert his advertisements in "The Amateur Photographer and Cinematographer," and from the complaints we have received it would appear that his practice is to communicate with private advertisers having goods for sale, offering to take such goods in exchange for others, or to purchase for cash. Readers are advised to ignore all such offers from this quarter.

CAMERAS AND LENSES

THIRD EDITION**MOTION PICTURES**

with the Baby Ciné

A Handbook on 9.5-mm. Cinematography

By

HAROLD B. ABBOTT

This handbook, specially written for amateur cinematographers, includes every aspect of the fascinating hobby of making motion pictures.

In the preparation of this third edition a thorough revision has been carried out. Much additional information has been included, and all important new apparatus has been brought under review.

The following Table of Contents indicates the wide range of the book and the completeness with which the subject is covered.

Hypersensitive PANCHROMATIC ROLL FILM

Any amateur, with any reasonably efficient camera, can now enjoy night photography, indoors and out, with Selo Hypersensitive Panchromatic Roll Film.

Made in England by **ILFORD LIMITED** • ILFORD • LONDON

The AMATEUR^{3D} PHOTOGRAPHER & CINEMATOPHOTOGRAPHER ~ The Journal for Everybody with a Camera ~

Vol. LXXVIII.

Wednesday, December 26th, 1934.

No. 2407.

With great charm, and without fuss or trouble, the Rolleicord has caught the expression of longing on the little girl's face as she gazes up at the coveted toy. Modelled on the lines of the famous Rolleiflex, the Rolleicord possesses many of its unique features which enable the photographer to get unusual and charming pictures with unusual simplicity. It is fully equipped for all-round winter photography—indoors or out—and makes a very handsome present—give yourself one to-day.

With Zeiss Triotar f/4.5 lens, **£10 : 10 : 0** Rolleicord Patented leather case £1 extra.

Your dealer will gladly demonstrate; or write for beautifully illustrated brochure from the Sole Importers:

R. F. HUNTER, LTD., "Celfix House," 51, Gray's Inn Road,
Phone: Holborn 7311/2 **LONDON, W.C.1**

Get your camera out to-night!

★ Inexpensive New Kodak Equipment makes

indoor picture-making at night easy.

Fast Kodak panchromatic films, extremely sensitive to artificial light, allow big reductions in exposure times. Handy, low-priced lighting aids provide brilliant, easily-controlled illumination in any room.

Fireside portraits, a bridge party, the kiddies at bath-time—new pictures in plenty—start making them to-night!

KODAK SUPER SENSITIVE PANCHROMATIC FILM.

The film of lightning speed. Highly sensitive to the red rays in which artificial light is especially rich.

"PANATOMIC" FILM.

Not quite so fast as "S.S. Pan," but still very much faster to artificial light than regular Kodak Film. Superfine grain.

THE NEW "PHOTOFLOOD" LAMP.

THE "KODAFLECTOR" JUNIOR.

THE "SASHALITE" OUTFIT.

NEW "PHOTOFLOOD" LAMP.

Plugs into ordinary electric light socket; gives intense, continuous light; one and half times as powerful as earlier type, yet reduced to nearly half the price. Lasts for approximately two hours continuous burning time, sufficient for an immense number of exposures. Safety fuse incorporated 4/-

"KODAFLECTOR" JUNIOR.

Reflector for "Photoflood"; increases effectiveness of illumination two and half times. Supplied with handy wire stand that can be stood on table, hung from wall, over chair, etc., in a dozen useful positions. Complete with 9 feet of flex, but without lamp 6/-

"SASHALITE" BULB.

The powderless successor to flashlight. Flash takes place in sealed glass bulb, fired by ordinary torch battery. No smoke, no smell, no danger. Each bulb gives one brilliant flash. Allows night-time indoor snapshots to be taken with any camera.

Per bulb, 10½d.

Complete Sashalite Outfit containing 2 Bulbs, Battery in Holder, and Metal-surfaced Collapsible Reflector 7/6

KODAK LIMITED, KODAK HOUSE, KINGSWAY, LONDON, W.C.2

THIRTEENTH EDITION WALL'S DICTIONARY OF PHOTOGRAPHY

AND REFERENCE BOOK FOR THE AMATEUR
AND PROFESSIONAL PHOTOGRAPHER

Edited and largely re-written by
F. J. MORTIMER, Hon. F.R.P.S.

All the latest photographic principles are incorporated in the present edition, which includes up-to-date information on such recent developments as infra-red, high-speed and colour photography. The volume provides practical information in dictionary form on every phase of the subject—technical, pictorial, scientific and general, and is in itself an explanatory index to all terms, formulæ, etc. Its contents are made readily accessible by the extensive use of cross references.

YOU CANNOT DO BETTER

The EXAKT ENLARGER

Fitted f/4.5 Steinheil Casar anastigmat complete with condenser and orange filter. Very simple adjustment to obtain size of enlargement required.

Model Ia for 2.5-10 times linear enlargements from 4 x 4 cm. negatives **£13:10:0**
 Nine monthly payments of 31/6.
 Model II for 2 to 7.8 times linear enlargements from 6 x 6 cm. negatives and sections of 1/2 plate. **£18:0:0**
 Nine monthly payments of 42/-.

THE NEW PATHSCOPE IMP PROJECTOR

Complete with motor drive and super-reel attachment. **£7:0:0**

Nine monthly payments of 16/4.
 A miniature Home Cinema for the projection of all Pathscope 30-ft. and 60-ft. films. Supplied complete with resistance for all house electricity mains up to 250 volts, this projector is convertible to a motor-driven model for the projection of all Pathscope 9.5-mm. films up to 300-ft. in length. Projector, without motor drive and super-reel attachment. **£4:12:6**

THE NEW DEKKO

The New DEKKO 9.5-mm. hand-driven Projector. Exceptional balance, silence and long life, due to the introduction of spiral gears and bronze bearings. Cast metal base for solidity and steadiness. The resistance is housed in this base, suitable for voltages from 110 to 250. Aluminium lamphouse designed to dissipate heat. Double the illumination of similar models, invaluable for dark and under-exposed films. New type of shutter between the lamp and film to eliminate burning and buckling of the film. Simplicity of threading and rewinding. Attractive appearance and finish. Price, complete with lamp and resistance **65/-**
 Carrying-case, extra. 5s. 0d.

VOL. LXXVIII. No. 2407.

THE year that is fast drawing to a close has been an eventful and busy one in the annals of amateur photography. Progress in all phases of camera work has been more definite than in previous years. This is due to a great extent to the perfection that has been reached in modern materials. It has clearly been a panchromatic year, and a year in which the precision miniature camera has asserted itself as a universal instrument for thousands of photographers. Where in the past faults in amateur work could in many cases be traced to the apparatus and material used, now only the faults of the amateur in their use remain to be discovered to explain indifferent results. All this has been to the good, and the quality of negative and print production has never been at a higher level, as witness our exhibitions and competitions. Glancing back over the pages of "The A.P." for the past twelve months we may be forgiven if we claim that this paper has also done its bit in helping and fostering the enthusiasm that is making amateur photography the best and most satisfying all-the-year-round hobby in the world.

The Press Photographer is Born.

It is a long day since we found a photographic meeting so hilarious as the Royal Photographic Society while it listened the other evening to the life story of Mr. James Jarché, the Press photographer. Mr. Jarché has been doing Press photography since 1909. His father and grandfather were photographers before him, he himself was born near a "barrel of hypo," and some of his earliest work was assisting in police photographs of bodies taken from the Thames near his

TOPICS of the Week

LONDON LANDSCAPES (No. 29).
A seasonable snapshot in Kensington Gardens.

ancestral studios at Rotherhithe. The result was that he grew up to loathe photography; his ideal was Hackenschmidt, and indeed he became the world's amateur middle-weight wrestling champion—a superb training for the rough and tumble of Press photography. But photography would not let him go. His mother gave him a camera for his birthday, he took the camera into Southwark Park, the camera took some children at play, the *Daily Mirror* took the picture, and Mr. Jarché took half a guinea, and his first step up the ladder which was to give him first-rate opportunities of "shooting" royalty, murderers and politicians.

The Miniature for Press Work.

The miniature camera, no doubt, has many advantages for the Press photographer, chiefly its unobtrusiveness, though whether it will oust all other models in this field, as Mr. Jarché believes, remains to be seen. Mr. Jarché has some interesting stories to tell of how, called upon to photograph prominent people, the idea being that he should make the set conventional study, he has seized the occasion to take a few more or less surreptitious photographs with the miniature, and the people concerned have preferred the results to the others. The Speaker of the House of Commons, for instance, was to be "done" in his wig and gown, but Mr. Jarché got a premature photograph of him in the act of adjusting these habiliments, and so good was it that the Speaker himself wrote and asked for copies. Along with his miniature, Mr. Jarché carries about with him a coil of wire, a reflector, and some lamps on different voltages which he can exchange,

if necessary, for those in use in the places he visits, being careful, of course, to avoid a fuse, and he gets interior exposures of one-twentieth or one-fortieth of a second, easily compassed when you know how to hold your elbows to your sides, and *not* to hold your breath.

The Call of the Diminutive.

The attraction of the Microscope Exhibition, at the Westminster Central Hall, persisted right up to the end. Going in on the last afternoon, we found ourselves at the end of the queue the front part of which had a hundred eyes glued to a hundred eyepieces. We have imagined ourselves waiting in queues to see various celebrities, but never to see the Bacillus anthrax in the kidney magnified 336 times. What is the spell which the microscope exercises over those who have no

special interest in its applications or subject-matter? Surely it is just the surprise of seeing things on a different scale, either larger or smaller, than that to which we are accustomed. We get the same delight in watching the image in a camera finder.

The News in Colour.

A journal published in Hollywood which came into our hands the other day predicts that very shortly the news reel in mere black and white will be a forgotten thing. It will be colour, colour all the way. Already some excellent essays in this way have been started. Colour, says the writer, can be shot on a single system news-reel recording outfit just as at present. Any news-reel camera-man can shoot three-colour pictures. He adds that no trouble of any kind will be experi-

enced in splitting beams of light, and that prints can be knocked out as fast as in monochrome. "Is not that food for thought?" he asks. No doubt, the more colour we can get, the better; and yet we wonder whether colour will have quite the popularity that is predicted for it. There is something about the black-and-white rendering which fits the presentation of news. It may be just the effect of long association and of acquaintance with the picture page of the newspaper, but, except in the case of elaborate pageants and scenic effects, the eye, on looking at the kind of spectacle which the news-reel records, sees it as movement in black and white and is largely oblivious of colour. Anyway, whether in monochrome or colour, the news-reel gains in popularity, witness the queues outside the picture houses which specialise in it.

READERS' PROBLEMS

Selected queries on topics of general interest to readers will be fully dealt with on this page week by week. Other replies appear as usual on the last page.

Lantern Slide Frame.

As I often wish to make contact slides from parts of 1/4-plate negatives I have been trying to manage with a 1/2-plate frame fitted with a sheet of glass on which the negative is laid. This does not answer. I think you have suggested some form of special frame, but am not sure. Can you help me?

G. E. C. (Liverpool.)

Certain frames are available commercially, but they do not all permit of centring the part to be printed on the lantern plate. Of those we have described and illustrated

suitable material glued on. The 3 1/4-in. square cut out of it is to be used as described later.

Fig. A shows this felt-covered side with the negative laid on it, and held in the required position by two springs, which can be swung round on the screws as in the case of springs on a printing-frame. If you use film negatives you must have a piece of clear glass to support them, and this will be held in position by the springs.

You will see that by turning the frame over you can drop the lantern plate into the square opening so that it will be in contact with the negative. It is now necessary to have a back to keep the plate in close contact, and shut out light from the back of the plate.

This fitting is shown in section at C. It is a square piece of wood, cut to be an easy fit in the opening, and with its face covered with the spare piece of felt. On to the other face is glued another piece of wood, rather larger in size, so as to project a little all round. When it is dropped into the opening it should just rise a trifle

from time to time that shown here is about the simplest, and we doubt if anything quite like it is now on the market.

It can easily be made. The materials required are small pieces of suitable wood, a piece of felt or other material, and three brass springs.

The main part of the frame is a piece of seasoned wood, say about 6 x 5 in., and about 1/4-in. thick, planed on both sides. From the middle is cut a square opening, 3 1/4 in. full. The lantern plate lies in this, so that it should be cut to allow the plate to go in and out easily, but with no unnecessary play.

One side of the wood has a piece of smooth felt or other

over the surface of the main frame. Fig. B shows the back in position, and the swing pressure spring to secure close contact.

The exact position of the negative can be decided in full light, making allowance for appropriate margins on the slide. The lantern plate can then be dropped into its place in the dark-room, with the assurance that the image will come just where it is required.

Incidentally, the frame can be used with equal facility for making masked bromide or gaslight prints from part of a larger negative, the masks used being cut out of pieces of thin opaque paper 3 1/4 in. square, and laid on the negative.

Films for the Miniature CAMERA in WINTER

The following note may prove of value at the present time to the many users of miniature cameras whose work shows a falling-off in quality for no apparent reason

THE user of a miniature camera will do well to take care with regard to the choice of a film for winter conditions out of doors. Films for these cameras differ considerably in respect of the contrast that they give in the resulting negatives.

The photographer who uses larger sizes often makes his negatives of greater contrast in order to secure bright prints under these conditions. The miniature camera user cannot do this to any great extent, for the resulting negatives may be too hard for the enlarging process, unless a very "soft" paper is employed.

Selection of Film.

The important point is to select a film for those subjects which are to be taken under poor lighting conditions, which will produce negatives of a little extra vigour without the excessive contrast that is not required.

Films by different makers offer a means to produce negatives of just the right type. There are some which, while they give negatives of ideal gradation for enlarging with the brilliant lighting of summer, do not give sufficient contrast for those subjects which have to be photographed out of doors upon dull days.

There are other films which produce just the extra that is necessary. This is not a matter of speed, because films by the various makers of approximately the same speed differ in the matter of gradation. Apart from this the film of lower speed will give a negative of a little extra "pluck" with a little longer development to compensate for a subject of low contrast.

Filters.

It is well known that the use of a deep filter with panchromatic material will allow of a much

clearer picture being secured when the exposure is made upon a dull or misty day. With super-rapid panchromatic film, and a lens working at $f/3.5$, it is possible to secure results with a miniature camera with ease which would be a difficult matter with larger apparatus.

Even if a deep filter is not permissible under such conditions the use of one of medium depth will make a surprising difference to the result. We have had excellent results using a lens aperture of $f/3.5$, super-rapid pan. film, and an exposure of $1/10$ th of a second upon dull, misty days, the lens being screened by a yellow filter.

The miniature camera user cannot always foresee the result of the use of a certain filter. There is the advantage that films are cheap, and exposures made rapidly one after the other with the miniature camera permit of the use of several different filters upon the same subject, and the best result selected.

The photographer will do well to keep careful note of the conditions which have produced the best result, so that there will be no doubt upon a future occasion.

Actinic Quality of the Light.

A point that exposure meters do not take into account, and also one which may easily be overlooked, is the increased sensitiveness of panchromatic films to red or yellow light. Exposures made towards the beginning or end of the day, when the light is rich in red rays, may be found to be over-exposed when fast pan. plates or films are used, and the negatives will prove to be mysteriously flat and dull.

Recently we were making some exposures just before sunset, and the negatives were over-exposed through omitting to realise the extreme sensitiveness of modern

panchromatic films to this lighting. Those who rely upon exposure calculators will be well advised to take the hint, and, under the conditions named, to keep exposures at the minimum.

Over-exposure is not desirable, and it may be experienced under the conditions mentioned, and especially when no filter is used on the lens.

Development.

Apart from the falling-off in quality that may arise during the dull days of winter due to the use of an unsuitable film, a still more important factor is the developer.

The worker who does his own developing and employs a tank has probably a favourite developer, and continues to use this. If it is a metol-hydroquinone formula—with or without borax—a fall of temperature will immediately affect the quality of the negatives. With any developer containing hydroquinone the temperature must be in the neighbourhood of 65 degrees Fahr.

Test the Temperature.

Most frequently it will be found, on testing the solution after developing, to be 50 degrees or lower. In this case the hydroquinone has become inert and the development has been continued with the other constituents only. Negatives produced under these conditions are generally lacking in gradation and appear flat and lifeless—quite different from thin negatives of good tonal gradation which enlarge perfectly. It will be wise, therefore, unless steps are taken to keep the temperature of the developer constant and at the right degree, to choose another formula in which hydroquinone does not play a part—such as Azol, Rytol, Rodinal, etc., which are excellent for the purpose; but even with these the temperature should not be allowed to drop too low.

Our Picture Pages

By
C. UPTON
COOKE.

WHEN you have read your current copy of "The A.P." what happens to it? Being a serious photographer and not a mere button-presser, you make a critical study of the pictures upon the art pages, extract and docket all formulae and information that are thought likely to be of future use, and then, usually, one of three things takes place: The journal is either lost sight of altogether, added to an accumulation of other copies, or else handed over to some other person interested in the practice of photography.

The first of these alternatives is the course more generally adopted, until the accumulation reaches a point when the powers that really rule the household call a halt and insist upon a complete clearance of what they invariably dub litter and lumber.

My own interest in photography was caught at the early age of twelve, but it was not until eight years later that the pages of *The Amateur Photographer* were first brought to my notice.

At about this time the introduction of supplementary art pages in "The A.P.," coupled with great advances made in the half-tone process and methods of printing, made the reproductions really valuable as records of representative work and of the photographic tendencies at the date of issue.

From then on, that is to say from

1908 until the present day, I have carefully detached all full-page pictures for the purpose of such records from "The A.P.," and the other journals that have since been incorporated with it.

A Collection of "A.P." Pictures.

A "One-Man" Show.

For about two years these pages were kept in the order of the date of their publication. As their numbers increased it became more and more difficult to trace and handle any particular picture wanted for reference. It was therefore decided to file them all in strict alphabetical order, not of their titles, but of the names of their respective producers.

This arrangement has proved entirely satisfactory. My practice is to allow the pages to accumulate to about a couple of hundred or thereabouts, and then to utilise a wet afternoon or evening in sorting and "setting in" the prints.

In sorting the prints great difficulty was found, and a heap of experience gained, in deciding which of two plates, printed as so many of them are on opposite sides of the same piece of

A Handful of Aces.

paper, should be chosen for the top, or filing, position. When thought necessary, cross references were made and filed of pictures appearing upon what we might call the reverse side of the page; these can then readily be picked out if and when required.

When the number of any particular photographer's pictures reached six or more they were abstracted from the file and fastened together with small wire paper-clips. These collections are also kept in alphabetical order, and in most cases are faced with such biographical pages as "The A.P." from time to time supplies, as, for instance, the series entitled "The Man and the Print."

These "One-Man Shows" now total eighty-six, and it is surprising to note how comprehensive they are. Taking a few of the sets, we find, for instance, no less than thirty-five examples of

the work of Harold Cazneaux, thirty-six of those of James McKissack, of Alex. Keighley's pictures there are fifty-one, and F. J. Mortimer is represented by sixty-five.

The photograph "A Handful of Aces" gives some idea of the representative character of these sets. A rough estimation of the number of pictures shown in "A Collection of 'A.P.' Pictures" would be in the neighbourhood of four thousand five hundred. They make a pile, closely packed one upon the other, fourteen inches high.

It may be asked why all this trouble has been taken, first in preserving and then in arranging them. Assuming, as most picture-lovers will, that their possession is desirable, then the time spent in placing them so that any individual print, or set of prints, can immediately be picked out for purposes

of examination, comparison, or what you will, is time very well spent.

The uses to which any Photographic Society or Camera Club could put such a collection, once made, are many. Pinned upon the walls or screens of the club-room, "One-Man Shows," as in the small set shown, are perhaps the most obvious. Separate sets of American, Australian, Japanese and Continental works lend themselves excellently to this purpose.

The most interesting use to which I put them is in selecting a series illustrative of some definite subject or phase of photographic interest. Subjects so dealt with have included Zoo, Portraiture, Child Studies, Genre, Seascapes, Nudes, Street Scenes, Romantic Landscape, "Stunt" Pictures, and Architecture, among many others.

Any one of these would provide a full evening's entertainment.

PHOTOGRAPHING BENCH ENDS By F. J. YOUNG.

READERS of "The A.P." have been introduced on more than one occasion to the quaint misericordes to be found in the choirs of so many of the ecclesiastical buildings of our land. Bench ends have not figured so frequently, and

A particularly fine example of a bench end is to be found in the choir of Ripon Minster. This "end" is crowned with a very realistic elephant and castle, the elephant having a victim between his front feet. Just below is the figure of a centaur, armed with a particularly villainous weapon, a spiked ball attached by a chain to a stout rod. The angels and the mitre seem rather out of keeping with the upper part of the design, and one wonders what influences had been at work on the mind of the craftsman!

In Christchurch Priory, near Bournemouth, is to be found a much more peaceful subject. At the end of the north choir stalls, facing the wonderful representation of the Stem of Jesse situated above the high altar, is a reproduction of the fruitful vine, crowned with some grotesque animal study. The carving is in bold relief, very graceful, and well repaying close attention.

Few visitors, having toiled up the steep High Street at Clovelly, trouble to go on to the peaceful parish church not far distant. Here are bench ends of quite another kind. A small, semi-circular shelf is attached low down to the ends of several of the pews, and give a glimpse of the departed social life of England. These were the seats allotted to the apprentices, outside the family pew. It must have entailed considerable skill on the part of a tired youth, overcome with sleep, to maintain his position on his uncomfortable perch.

As regards the actual photography it is a great help to be able to use a camera with a focussing screen, as the

subject is often a "tight fit," and care must be taken to secure the whole of it. Further, with a focussing screen it is possible to decide which is the largest stop that will give satisfactory definition, and so probably shorten the necessary exposure considerably.

At Ripon.

At Christchurch.

to the beginner in this fascinating branch of photography they present fewer difficulties, as they are generally more accessible and have better lighting conditions than the misericordes.

No particular type of plate or film is required. The great point is to give ample exposure, curtailing development for contrasty examples, and increasing it when the subject is on the flat side.

PASSING

By MARJORIE LIVINGSTON.

Londoners of some very beautiful and delicate architecture.

Clifford's Inn Hall has received less attention than it has deserved at the hands of the pictorialist, probably on account of the difficulty of viewpoint. To come in sight of

Clifford's Inn Hall. $1/30$ th sec., $f/11$, S.S. pan. film, Alpha filter.

WITH the passing of the old year one is reminded of the passing of more concrete things that surround us. Their absence is only realised when it is too late to make a record with the camera. Waterloo Bridge has excited so much attention recently that photographers are apt to overlook the fact that many other famous landmarks are disappearing from sight.

That beautiful old "Wren" church, for instance, All Hallows', Lombard Street, is condemned. Its foundations are Roman, and the crypt, containing genuine Roman stonework in good preservation, is still accessible to the public. But this state of affairs may not remain for long.

"The Old Lady of Threadneedle Street" is now no more than a shell of her former self, whilst, within the void, work proceeds, and the work in itself presents a picturesque spectacle to the enthusiastic camera-man.

"Big Ben," another familiar London character, has for some time been seen "in splints." Photographs of Big Ben are common, but it may be many a long day before he looks again as if he had been "in the wars," as at present.

Perhaps the richest opportunities for interesting camera-work will occur when the first pickaxe is carried into Clifford's Inn. This will preface the doom of a very ancient and familiar landmark, and the loss to

Big Ben in Splints. $1/30$ th sec., $f/8$, S.S. pan. film.

The Gateway of Clifford's Inn. $1/10$ th sec., $f/4.5$, S.S. pan. film.

the Hall at all is to approach too near to it for a successful picture. The photograph illustrating this article was taken from the tower of St. Dunstan's-in-the-West, Fleet Street, a giddy height indeed, but one which gives a wonderful vista of workaday London.

So the old order passes, and those who have neglected to go out after some records of this doomed architecture will soon have lost for ever the opportunity to preserve the memorial of its old-fashioned beauty in the pages of their albums, where it might

LONDON

remain of lasting interest not only to the present generation which recognises it, but to the coming generation to which it will be past history.

Meanwhile, in the place of the old, new buildings arise, and there are many striking contrasts between the ancient and the modern structures. Fresh-quarried stone and crumbling bricks; chromium arches

Waterloo Bridge. $\frac{1}{50}$ th sec., $f/8$, S.S. pan. film, Alpha filter.

camera can be used for the purpose, and the photographs may, in years to come, become of the greatest value to the archæologist and historian.

Reconstructing the Bank of England. $\frac{1}{50}$ th sec., $f/8$, S.S. pan. film.

and moss-grown mullions are huddled willy-nilly wherever the photographer may wander, camera in hand.

Much the same thing is happening in other towns and cities throughout the land, but because of its extent there is more to be seen in London. Every amateur photographer therefore, wherever he may be situated, should miss no opportunity of securing records of historic buildings and places that are threatened. Any

Winter Sunshine *Among the Trees*

By H. W. ANGELL.

TREES and sunshine—subjects available to all of us, and equally fascinating in winter as in summer. Splendid pictures can be secured, and will have added charms in the unusual effects obtained. There is the lacework pattern of bare branches and twigs, with winter sunshine throwing shadows of these to form further patterns at our feet. On some days mist and sunshine are present together, making possible pictures of exquisite beauty.

Winter sunshine is brief, and only the middle hours of the

Leafless Majesty.

Sunshine through the Trees.

day are suitable for photography if the full effect of the sunshine is to be obtained. Fortunately, modern transport makes it easy for even the town-dweller to reach his subject within a reasonable time and without much expense.

A tripod should be included with the apparatus carried, as exposures are often too lengthy for the camera to be held in the hand. Adequate exposure is essential if results are to be satisfactory. Photographers using calculators should remember that the trees in most cases cut off a considerable amount of the light, and allowance for this must accordingly be made.

When it is desired to retain the effect of mist it is better not to use a filter, but when expanses of sky are included in the picture a K 1 or similar can be employed with advantage. In this case pan. films or plates should be used, but for general use films of the 'chrome' type are excellent for this work. Development, as usual, should not be carried too far or the delicate tones will be destroyed, particularly when the effect of sunshine and mist form an essential part of the picture.

“Mass Production” of Prints

PRINTING eighty-four whole-plate enlargements in a few hours is an experience that the amateur is not often called upon to undertake.

A short description of the method I adopted for dealing with such a problem may be of interest to other readers of *The Amateur Photographer*, and may prove useful, should they ever find themselves called upon to undertake

a similar big job, for it was a big job to an amateur who does his work in a darkened kitchen and with a home-made enlarging easel.

A certain school near my home was recently celebrating its 136th anniversary, and the officials were very keen to have a photograph of the assembled pupils.

The lighting conditions were not of the best, but an Ilford Hyper-sensitive

A tip for making Greeting Cards on a large scale at home.

plate, with an exposure of two seconds (in daylight) at f/5.6, gave a perfect negative. Those concerned were so pleased with the result that a sepia-toned 15×12 enlargement was ordered from one of the advertisers in *The Amateur Photographer*, and in an impulsive moment I offered to do a few whole-plate enlargements for any who would like a 'copy'. It was suggested that a

charge of sixpence be made, the proceeds to help to swell the school funds, but it was rather a shock to find that eighty-four people each wanted a copy.

As, at first, it seemed beyond my powers I obtained an estimate from the firm who made the 15×12 in. enlargement. The price worked out at eightpence per copy—a most reasonable figure—but fifty-six shillings was rather steep, in these hard times! Then the advertisement columns of *The Amateur Photographer* revealed the fact that a gross of whole-plate sheets of bromide paper could be bought for nine shillings.

The work was therefore undertaken at home, gallantly assisted by my wife, for it was soon very evident that it was a "two-man" job. With a 60-watt lamp, enlarger aperture f/8 and an exposure of twenty seconds, the enlargement was just right, and in two evenings the eighty-four enlargements were printed. The manipulation of the easel and paper was my job, and my assistant controlled the enlarger and yellow lamp switches and timed the exposures.

Then came the developing. Johnson's M.Q. packet developer was used and it

took four of their threepenny packets, which made 40 oz. of solution. This means that 10 oz. developed twenty-one whole-plate prints, which sounds excessive, but there was no sign of deterioration in the colour of the prints.

The developing dish and packet of undeveloped enlargements occupied one end of a long table, in the centre was a large bowl with clean water for the intermediate rinse between developing and fixing, and at the opposite end of the table were two 10×8 in. dishes of acid-hypo.

Each print took exactly ninety seconds to develop fully, with the M.Q. at 70°. The first enlargement was developed and rinsed and placed in hypo bath No. 1 face downwards. Print No. 2 was developed, etc., and placed in hypo bath No. 1, face downwards, and the first print turned face upwards. At the end of five minutes prints 1 and 2 were transferred to hypo dish No. 2, and prints 3 and 4 placed back to back in dish No. 1; at the end of ten minutes the first two prints were transferred to another large bowl for their final wash.

In this way the prints were never

touched by me after developing and rinsing them in water, the whole of the fixing and washing being done by the second worker. The eighty-four enlargements were developed in two nights of two and a half hours each, and the job finished, with two sighs of relief.

The total cost, apart from the time taken, was seven shillings, and the school funds benefited to the extent of forty-two shillings. It is realised that the price of sixpence per print was much too low, and the writer feels that the work savoured rather of "black-legging." No doubt another time the work will be done by a local firm of photographers.

The experience gained was very valuable, and what might have been a "nightmare" to one worker became simply a matter of routine when handled by two people. The washing was considerably simplified by having two large bowls and constantly changing prints from one to the other, the water being introduced into the bottoms of the bowls by means of a short length of rubber tubing.

Altogether an interesting job, but not one to be tackled very often.

G. R. HINKS.

An Easily Constructed Dark-room Lamp for Electric Light

By H. COSTELLO.

WHEN developing bromide prints it is difficult to determine the point at which the desired depth of colour is reached unless a good yellow light is available. With a ruby-coloured light, the tones look much darker than they will appear in a white light, and this makes it difficult to judge the best time to remove the print from the developer.

The lamp described here deals effectively with the question of a bright yet safe yellow light for bromide and gas-light printing, and may also readily be adapted to provide a ruby light for the development of plates and films.

The necessary material for its construction, if not already to be found in the household "spare parts box," can be purchased at the sixpenny stores. The items are, one small size lampholder with shade-locking ring, one plug, a suitable length of insulated "twin" wire, and one "candle" lamp of suitable voltage, this being, as will be seen from the illustration, the type of lamp used to simulate a candle flame. This type, being but an inch in diameter over all, fits readily into the smaller jar.

The other requirements are a 2-lb. glass jam-jar and a screw-top jar with straight sides, such as is used for honey, together with a tin-lid that will approximately fit the first-mentioned jar.

First bore a three-quarter inch hole in the centre of each lid with a brace and bit. Then clean the ends of the wire and fit them respectively by means of the set screws into the plug and lampholder. Next fix the two lids together by placing the smaller lid inside the

larger and fastening them together by the shade ring on the lamp-holder. The candle-lamp can now be placed in the holder and the honey-jar screwed into position.

If the larger lid is not a perfect fit to the outer jar, a length of adhesive tape wound round the neck of the jar will make it light-tight. A strip of black paper about 1½ in. wide should then be "Seccotined" in position round the top of the jar, an elastic band holding it in position until the glue is set. All that is now required is sufficient crystals of bichromate of potash—two pennyworth is ample—to make a saturated solution. This is poured into the outer

jar until, when the smaller jar with lamp is placed in position, the liquid rises to the black binding and cuts off the white light.

There need be no anxiety regarding expansion or spilling if only just enough solution is used to reach just above the edge of the paper. It will be found that the outer jar and its contents do not even begin to become warm to the touch until the lamp has been in use for some two hours at least. When developing plates or films (non-panchromatic) a loose cylinder of ruby fabric, obtainable from any photographic supplier, may be slipped over the outer jar and held in place with an elastic band.

With the Beginners

Every week an article will appear under this heading dealing with a topic of interest to the novice in photography.

NOTES & NOTIONS
for the
LESS ADVANCED
WORKER

A GREAT PHOTOGRAPHIC TEACHER.

FOR a long stretch of years there were no initials at the end of photographic articles so familiar as those of R. C. B. They were, of course, the initials of Roger Child Bayley, whom we have so recently and unexpectedly lost.

While he was editor of *Photography* he took the bold course of enlarging the paper and raising the price from a penny to threepence. It happened that the very first article in the new issue of the paper (January, 1903) was one of my own; and although R. C. B. had previously printed articles of mine, and given me a good many medals, it was this particular contribution which gave him the idea of my writing the "Piffle" page, which ran uninterruptedly for twenty-five years.

Till 1903 we had been merely names to each other; from that date we became close and intimate friends. As he was once good enough to say, it was a friendship without a single cloud. To be candid, there certainly

was one point on which I never agreed with him, and that was his use of the semi-colon! If he could only write again he might put a semi-colon after every word without comment from me.

He was a particularly sound and lucid mentor for all photographers. He knew just what they wanted; or perhaps I should rather say he knew just what was good for them, and saw to it that they got it in full measure. He was singularly patient with beginners, for whom he wrote series after series of lessons, which, in my opinion, were inimitable.

Large numbers of these lessons, and much of his other writings, were done in the open air. He deeply loved a garden. The one in which you see him sitting was at his cottage in Essendon. In one corner was a bed in which a thousand tulips grew every spring, and his rose trees were counted in hundreds. He is sitting just outside the veranda under which he wrote. I have seen him turn out sheet after sheet in that minute and fastidious penmanship which seemed so strange for a man of his build.

The other print shows part of the back of his house at Little Berkhamstead. You may recollect some other illustrations I used of the same place some time ago, without saying where they were. I thought you would like to see them because they are significant of the character of one who loved beautiful things.

At the middle of 1925 R. C. B. ceased to be editor of "The A.P.," and his last editorial lesson was on "Making Clean Negatives." But he probably had some more lessons written in advance—he was a perfect Titan at work—for lessons continued to appear each week until the end of September, when his initials

appeared for the last time at the end of an article on "Exposure."

Other hands produced lessons for beginners, one series under the heading of "The Novice," and another of "The Snapshotter." Then in July, 1929, I began the present series—not logically consecutive and methodical, as R. C. B.'s were, but rambling and irresponsible, as I foretold they would be.

Many beginners are unaware that they can still have the benefit of R. C. B.'s teaching. Based on the lessons is his book, "Photography Made Easy." I am not advertising it, but giving a most valuable hint.

Of course, Child Bayley wrote for others besides beginners, although his "Hand Cameras" and the out-of-print "Enlarging" were mainly for their benefit. But undoubtedly his greatest photographic book was "The Complete Photographer." I was talking the other day to a photographic friend—a front-rank pictorialist—who told me that when he began he had no other guidance for years besides this book. I can quite understand it, for I consider this the most perfect book of its kind ever written.

It is in this book that we find some very happy touches of humour, and R. C. B. was both witty and

humorous. But I do not recall anything of the sort in his practical articles, in which he was always intent on making everything clear. He could be rather caustic on occasion, but never so in the case of the humble seeker after knowledge. This was always shown when he was dealing with the hundreds of questions that reached him. He would spend any amount of time in finding out exactly what the questioner's trouble was, and then in a quiet, patient manner he would make the trouble vanish for ever.

It was for the bombastic and the self-conceited that he reserved his irony; to the puzzled beginner he was all kindness and wisdom. That is why I feel that the beginner, above all, lost a great photographic teacher and friend when he laid down his pen. His knowledge was great; his desire to guide and help was still greater. I knew him better than most. I have been, as it were, behind the scenes with him, and I know the work he did, and its value. "He was my friend, faithful and just to me." Often he was more generous than just. For I am one of the thousands of those whom he helped, advised and encouraged; and I shall always remember him, as we all should, not only with gratitude but with affection.

CUT-OUT MOUNTS

By
R. M. FANSTONE.

FASHIONS in the mounting of photographic prints change from time to time, but, although less in use than formerly, there is much to be said in favour of the cut-out opening with the print supported upon another mount behind, the whole forming one mount. Provided that the mounting is neatly done, this method can be most effective.

The "cut-out" style of mounting has certain practical advantages. These are especially marked in the case of exhibition prints, particularly if they are bromoils. The surface of the print is given additional protection by reason of the fact that the mount rises above it, and there is less risk of damage in transit.

The print, which need not be trimmed, is attached by the edges only, so that remounting, if necessary, is an easy matter. It may be that if the outer mount becomes soiled, this can be renewed without the need to remount the print. Another advantage of this is that when lightweight mounting materials are used, the prints do not cockle.

There are excellent mounting materials available for the purpose. Whatman papers are very effective, but are also expensive. There are the grades of papers used by printers for the better class of programmes and book covers, some having very attractive surfaces suggestive of hand-made papers. These are supplied in large sheets at a very low cost.

This style of mounting needs to be neatly done, but provided that a little care is exercised no difficulty will be experienced. The materials are few. A drawing-board of a size larger than the largest mount. This should be covered with ten or twelve thicknesses of newspaper to provide a good cutting surface. This paper should be attached to the board at the corners with drawing-pins. The other requirements are a steel rule for a cutting guide, a set-square, and a print-trimming knife. Failing the latter, a good sharp penknife, or one of the several patent holders for utilising discarded safety-razor blades, will be found excellent.

The first step is to mark very lightly in pencil the exact position of the cut-out opening. The best way of doing this is to pin the mount to the drawing-board, and with the aid of the set-square to mark out the opening. This opening must be slightly smaller than the area of the picture it is desired to show. Care needs to be exercised in order to ensure that the opening is square, and all corners rectangular. The opening should have equal margins at top and sides but more at the bottom.

In cutting the opening, the guide, which should be of thin metal, should be laid on the mount, and pressed firmly down. The cut should begin at the corner of the rectangle, and the cutting knife pressed into the mount. It is then drawn firmly but

slowly along the line to be cut, great care being taken not to allow the cut to go beyond the edge of the next rectangle. The other sections should be cut in the same manner, and if properly done the section will fall out, when the mount is unpinned from the board. If it is found that at any part the cut is not complete, a careful re-cut with the straight-edge will put the matter right.

The outer edges should then be trimmed up, and another piece of the same mounting stock cut to form the back of the mount. If desired the final trimming may be done after the mount has been assembled.

The print may be fixed to the inner section of the mount in a previously marked position by attaching with a good mounting paste at the edges. Another method is that of attaching the print at the edges by means of passe-partout binding, or the thin adhesive paper used for the repair of music will serve. This is an excellent means of attaching the print, especially if it is thought that it may be necessary to transfer the print to another mount at some future time, when it is an easy matter to cut through or detach the retaining strips.

The two sections of the mount may be attached to each other by coating the edges with mountant. It is a good plan to place the print under pressure until the adhesive is quite dry.

How I make my EXHIBITION PICTURES

No.
CCLXI.

Mr. J.
LUDLAM.

Methods and Ideals of well-known Pictorial Workers.

From information communicated to our Special Representative.

"I HAVE always been very fond of pictures, and in my youthful days I spent a considerable time in painting in oil and water-colour. How I drifted into photography I do not know, but I found it so fascinating that it soon weaned me from my first love, and I have never regretted it.

"As regards my photographic aims, I am one of the old type—very conservative in my methods. All my outdoor work is done with a small reflex, or a $3\frac{1}{2} \times 2\frac{1}{2}$ Sibyl of the

original model; but for interior work I use a stand, and generally the Sibyl, this having a very good rising front for the size of the plate. When I want detail in architecture I resort to a quarter-plate Sanderson, and use a telephoto lens.

"My preference in plates is for anti-screen or self-screened ortho. I have tried soft gradation panchromatic plates, but in my hands they do not give the gradation I require. They may be very good plates for highly-coloured objects, but in general outdoor work we do not often meet with such. There is generally that all-pervading grey which softens down all crudeness of colour.

"I keep no account of details of exposure, but always make notes regarding the contrasts in the subject, so that I know how to work with my developer, which has always been pyro-soda. I use the 'British Journal' formula, which keeps the negatives a uniform colour.

"For lantern-slide work I like a full-graded negative, with no bare glass; one that will give a good print on P.O.P. I have no use for an under-exposed negative at all, and for enlarging purposes I like to develop the negative soft, with full gradation.

"The bromide paper I prefer is one with a natural surface, which gives just sufficient sheen to preserve the foreground shadows, and keep them more transparent. I eschew all blackleading and oil rags, and pavement-artists' tricks, and aim at an all-photographic result. All the prints I have ever shown are straight work. The only deviation from this is judicious spotting, and working out small blemishes; and also careful shading of parts during exposure, which is essential and therefore cannot be avoided. If photographers paid a little more careful consideration in developing their negatives they would save themselves a tremendous amount of after-work on their prints, and give themselves more satisfaction.

"To get the exposure for the enlargement I always resort to the time-honoured method of exposing a strip of paper on the average density of the negative, giving varied exposures by shading with a piece of cardboard. I then develop it right out, so that it will go no farther. It is easy to see which strip has had the exposure which will give the best result. There is always a quality about a print which has been developed to the full, which other prints lack.

"When we come to the æsthetic side of photography, stunts do not appeal to me; I want something true to life. Yet a print may violate all the rules of composition and still be attractive and give one pleasure to see, and remind one of the pleasant time one had, and the happy days spent with the camera; and that alone is sufficient to justify the time and trouble taken in producing it."

PICTURES of the WEEK

Some Critical Comments on the Beginners' prints reproduced on the opposite page.

THAT the value of including an appropriate sky in a picture is not wholly unappreciated is demonstrated in the collection of prints reproduced on the opposite page, for, in every case, not only is there a definite degree of tone, but, in most of them, the rendering of cloud forms is decidedly promising.

Skies and the Picture.

In the case of No. 1, "The Shores of Loch Katrine," by Miss Vera E. Higgins, the effect is particularly good. There is a fine feeling of luminosity, mainly attributable to the concentration of light towards the horizon, and a very real sense of a recession of planes, as much in the sky as in the landscape.

This is by no means easy to achieve, but, aided by an accurate estimation of the exposure required and suitable after-treatment, it has been secured in this instance. There is no sign of over-exposure of the sky, and none of under-exposure in the landscape. Even with the most colour-sensitive of emulsions, there must always be something in the nature of a compromise between these two factors, and, with those that are less sensitive in this respect and are much more commonly used, the need for an accurate adjustment of the two is more than ever necessary.

A frontal lighting, or one that has its source to the rear of the viewer, is of considerable assistance, but, nevertheless, there is still need for care, and, in this particular case, the rendering is helped, to some extent, by the diffused character of the illumination.

It is quite a good piece of work, although, incidentally, a slightly more distant viewpoint would have been advantageous, as it would have enabled the base and top of the near tree to be included.

Against the Light.

In subjects of the sunset type, which, necessarily, are seen against the light, it is much more difficult to ensure an effective compromise.

Not only is the sky relatively lighter, but, as a general rule, the landscape does not receive by any means the same proportion of the illumination. Moreover, being indirect or reflected, its photographic value is

disproportionately ineffective, so that, if the exposure is short enough to avoid over-exposure of the sky, it is almost inevitably inadequate for the landscape.

It is on this account that the rendering of the landscape is so dark—a concomitant of under-exposure—in Nos. 2 and 3, "Sunset," by S. M. Elton, and the print bearing the same title by Miss G. O. Taylor. The sky is satisfactorily rendered in both cases, but the landscape is not. It might be argued that, with the main interest in the sky, the landscape is unimportant; but, while there is a certain amount of truth in the contention, it can scarcely be extended so far as to justify a foreground of practically solid black, for neither is such a rendering compatible with what the visual impression would be, nor is it acceptable from a photographic or artistic point of view.

On the other hand, as long as the ordinary run of emulsions is employed, no compromise can be really effective, for directly the exposure is increased to provide a better rendering of the landscape, the sky becomes over-exposed; and, if there be little loss in gradation in the sky portion of the negative, it is impossible to print to a proper depth without some dodging about.

Control and Effect.

This means masking the landscape while allowing the sky to register, and, in effect, amounts to controlling the result. Judiciously employed, there can be no objection to the expedient as long as it does not become apparent, but it is not the same thing as getting the effect by purely photographic means.

Better straightforward renderings can be obtained by the use of panchromatic emulsions, suitably screened. Even with these, there has to be something in the nature of a compromise, particularly if the landscape be dark in tone; but, all the same, the representations they provide are so superior to those given by ordinary emulsions that, if this sort of subject is essayed, they should be employed whenever possible. It may be as well to mention, however, that care in the choice of the landscape to accompany skies of this type will do much to avoid

the marked incongruity between skies and landscapes such as is shown in these two instances, whatever the class of plate or film in use; and, if the landscape be light in tone, subsequent treatment is greatly facilitated.

Local Colour.

If the local colour of the landscape be fairly bright, the chances of a proper rendering are higher, a fact which is exemplified in Nos. 5 and 6, "A Somerset Bay," by D. Kallenborn, and "Sunlight and Shadow," by W. H. S. Berry.

The former shows a more veracious rendering of the tone values of the landscape section than the latter; but, in both, some gradation is visible, and, though the foregrounds are too dark, they are not so dark as to pass the bounds of credibility. At the same time, it must be admitted that there is not quite the same quality in the way the tones of the sky are displayed as there was in the skies of the prints previously discussed, the finer distinctions between lights and the brighter lights within them being missing.

Viewed in the light of a compromise, either could be taken as acceptable, but Nos. 4 and 7, "Glen Nevis," by M. O. Sheffield, and "A Stormy Evening," by G. L. Mallett, where the subjects are helped considerably by the lighter tones of the landscapes, attain a somewhat higher level.

Choice of Material.

The presentation of the effect in the sky is enhanced by a careful choice of the material for the landscape. Consequently the tones of both are more fully recorded than in any of the other examples, except, perhaps, No. 1.

They do, nevertheless, fall short of what would have been possible had the more fully corrected panchromatic emulsions been employed in conjunction with a light filter of appropriate characteristics, and, particularly in the case of a scene like "Glen Nevis," the improvement that could be achieved would have to be seen to be believed. A trial, whenever such a subject presents itself again, is recommended, and the slight extra trouble needful in after-treatment will be found to be well repaid.

"MENTOR." •

Pictorial Analysis

Every week one of the pictures reproduced on an art page will be analysed in detail for the benefit of readers of the paper who are seeking to improve their pictorial work.

"CALIFORNIA WINE," by Shimsaku Izumi.

A PART from its convivial suggestions, which are by no means inappropriate at this season, this picture is interesting as an example of a class of work that can be attempted throughout the year, either by daylight or artificial illumination, and one that might particularly well be tried during the winter, when conditions out of doors are not inviting.

Form and Arrangement.

The fact that any form of lighting may be employed makes it a suitable pastime at all times, and, if the short hours of daylight during the winter are found a bar, it can be carried on under electric or any other form of artificial illumination.

In point of fact, the power of control which artificial lighting affords renders it preferable, and, as its power is constant, exposure difficulties, once the question has been determined by experiment, need not arise, provided, of course, the elements remain the same and the distance from light to subject is always equivalent. A like power of control extends to the arrangement of the subject material, and even if we have no especial *flair* for still-life and indoor work, there is but little doubt that the necessity for actually building up the composition can and will prove useful when other work in which we are really interested comes to be dealt with.

It is true that there is a great difference between the making of a composition and choosing a subject as it exists, but it is no less a fact that the experience gained in the first direction enables the points of an existing subject to be quickly assessed and the most favourable point of view to be adopted instinctively.

Construction and Arrangement.

From this standpoint alone, still-life has a justification, even though it

may not be practised for its own sake. Nevertheless, it has its adherents, and, as in this instance, they are able to make pictures that compel our admiration.

Nor is the work as easy as, at first glance, it might seem. It may sound a more simple thing to make up a subject, use what lighting we fancy,

elements will invite expression in the form of a picture. A chance arrangement of breakfast things has, in the past, provided the subject matter for a successful study, and like examples might be quoted indefinitely. Supposing, however, we take it that the first conception, here, arose from a choice of the wine flask (1), the glass, corkscrew and tray would naturally suggest themselves as appropriate subordinate elements, and experiments would have to be made to see how best they could be combined.

The flask, in all probability, would be placed in a fixed position and studied from various angles. It is more or less symmetrical in shape, but there are the handles and a label which suggest the possibility of avoiding too great an approach to formality. How these should be disposed would then be tentatively arranged—the idea being to allow for alteration, if required, later on when the arrangement has taken shape—and, after that, the tray (2) would probably be tried in alternative positions till its lines seemed to harmonise with those of the flask. Then, the wine glass (3) would be added, and, subsequently, the corkscrew (4), the whole then being viewed on the focussing screen to determine how much or how little to include.

and then take it, than to choose, for instance, a landscape scene; but, in actual practice, it will be found that there is not much difference between the two. It is, more or less, a difference in the method of approach. With an outdoor subject, selection determines both arrangement and motive, and, with still-life, arrangement and motive form the commencement.

A single object may suggest an idea, and, developing that idea, the accessories may seem to come of themselves, or it is possible that a fortuitous glance at a collection of

Adjustment in Stages.

With each addition, however, some adjustment would be called for in those elements already placed until the arrangement became more complete.

The composition would be built up in stages, and, when apparently complete, further adjustments might be found desirable following upon the final arrangement of the lighting. The possible variations are infinite, but that a most pleasing one has been chosen is conclusively shown by the undoubted attraction the picture exhibits.

"MENTOR."

Letters to the Editor

The Editor is not responsible for the opinions of his correspondents.

THE MINIATURE CAMERA.

SIR,—Mr. Burr's complaint of bad definition interests me, as I consider that the lens is the last thing to blame for this trouble.

I have produced negatives of perfect definition with lenses varying in cost from half a crown to £9 10s., and in size from 35-mm. to $\frac{1}{4}$ plate. I have also produced many specimens of thoroughly bad definition with the same lenses. Ninety per cent of the failures are, in my opinion, due to camera movement, especially when using a camera at eye-level. Another cause is that the film does not lie dead flat in the camera. This is of little moment when using a small aperture, but at $f/4.5$ it becomes of vital importance. A third cause of bad definition on distant subjects is due to a strange idea on the part of the camera-maker. Some manufacturers so arrange matters that the infinity catch comes into operation at 30 to 40 feet instead of at the true infinity position. I have found this defect, for so I term it, in one of the most expensive cameras on the market.

As regards the miniature camera, I think the time has come for a little "de-bunking." I have used a 24×36 mm. camera for a year and am still enthusiastic about it, but does anyone really believe that a whole-plate enlargement from such a camera is in any way better than one from a $2\frac{1}{2} \times 3\frac{1}{4}$ negative? The only real advantage I can see is that one may use a lens of an aperture that, in a larger camera, would bring a more or less polite communication from one's bank manager.

And yet hundreds of amateurs are persuaded that the possession of an expensive miniature means the end of all their troubles, and a constant stream of perfect enlargements. I firmly believe that until a man has learned to produce a really good whole-plate picture with a camera costing £3 or so, it is not much use purchasing an expensive instrument, miniature or otherwise. Heresy again, I am afraid, but heresy in hobbies pays handsomely.—Yours, etc., H. BRAITHWAITE.

FINE-GRAIN FILMS.

SIR,—With reference to the letter from Mr. W. H. Clarkson in your issue for December 5th, wherein he pleads for fine-grain film packs, may I point out that Kodak Panatomic film packs are now available in at least two sizes—namely, V.P. and $3\frac{1}{2} \times 2\frac{1}{2}$. I purchased my first one over a week ago, and, in common with your correspondent, feel they supply a long-felt need.—Yours, etc., C. H. W. KEY.

ANASTIGMAT LENS.

SIR,—I deeply regret that Mr. H. S. Burdett has been misled by my previous letter, but I must reassure him that the explanation put forward was not erroneous. Possibly the last sentence in that letter was misleading, but actually it was introduced to show that although no two points in the plane of the plate are equidistant from the lens, the plane of the plate remains always at a constant distance from the plane of the lens. Another fact remains: if a camera is focussed on a plane, containing, say, two objects, then the actual distances from the lens of the two images formed vary as the actual distances of the objects. Anyone conversant with plane geometry can prove the truth of the latter statement from the similar triangles embraced by the field of view of the camera lens.

I attempted in my letter to illustrate just the distance between the planes of the subject and the lens which decides where the image will be. Mr. Burdett still supposes we must consider that the corner of the wall, when we focus upon it, is "farther away" than the centre. If this distance is measured with two pins and a piece of cotton this, no doubt, is true, but I should not have thought that Mr. Burdett would have been troubled by this obvious fallacy.

I apologise to other readers who may have been misled by my letter.—Yours etc. K. M. BEVINS.

DEVELOPING TANKS.

SIR,—I have read with interest the correspondence on the above subject. I have used Kodak roll-film developing tanks since they were first brought out, which must be something like thirty-five years ago.

I cannot recollect ever having the emulsion side of the film give trouble from touching the apron when using Kodak film. Where I have had this trouble I think I have tracked it down to the indifferent quality of the adhesive paper at the ends of some makes of film.

It is essential that the film should be firmly attached to the backing paper at both ends, and remain attached until the emulsion side is thoroughly wet and limp.

If the adhesive paper is porous and the adhesive weak it slips before the film has become limp and lost its "curl."

It must be remembered that the film is rolled up in the apron with its curl in the opposite direction to the curl it has acquired on its spool, and until it is limp the only thing that keeps it from trying to resume its original curl and touching the wrong side of the apron is the pull of the two adhesive end papers.

Owing to the film and its backing paper being rolled up the reverse way in the apron the portion of the backing paper between the two stuck-down ends of the film is slightly shorter than the film and all the tension comes on the adhesive papers.

For this reason the adhesive quality of the end papers is more important than the tension recommended by some of your correspondents.

I always regarded the dimples on the apron as a mistake. In the earlier smooth apron the backing-paper and the back of the film itself remained nearly dry. The pressure of the water was all on the emulsion side pressing the film more firmly against the backing paper and apron and the curl in the desired direction was assisted by the convex surface of the film being wet and the concave dry.

Obstinate adhesion of the backing paper to the back of the film I have only experienced with a foreign panchromatic film I use; but as it is not provided with adhesive paper to stick down the free end it is obviously not intended for use in this type of tank, and the fault was mine for attempting to do so.—Yours, etc., G. T. BIRKS.

CAMERA PRICES.

SIR,—I was interested in the letter from Mr. A. Nation which appears in "The A.P." of October 24th. But his remarks about the miniature camera are so extraordinary that they detract from the value attaching to his opinions on other matters. He says, "A miniature I would never buy, as I think they are but a passing craze."

It is a pity that anyone who has not owned a miniature camera should condemn them. I have worked with many cameras, and am now the delighted possessor of a twenty-five-pound miniature of German origin. I consider it remarkably cheap at the price, by far the best camera I have ever had, and the easiest to work. When the initial cost is paid, the "running costs" are very much lower than any other. In fact, it is not too much to say that, at the end of two years, I shall have more than saved its price in the low running costs. Moreover, I have never had so few failures, for though I am by no means an expert, it is a common thing to get all thirty-six exposures "printable." I develop the films in a Correx tank (another splendid and remarkably cheap invention) and I do my own enlarging. And, not allowing anything for depreciation, a half-plate enlargement (negative, bromide paper and chemicals) costs less than three-halfpence. I have no need for any other camera, for my miniature does nearly everything they can do, and a great many things they can't do, and it does everything better and cheaper. There is one question I should like to ask Mr. A. Nation. Using the materials he mentions in his letter, has he ever entered any of his photographs in an exhibition and had them accepted?—Yours, etc., A. T. WALLIS.

NEWS AND REVIEWS

ITEMS OF GENERAL INTEREST FROM ALL QUARTERS.

An exhibition of outstanding interest will be opened in London at the Royal Water Colour Society's Gallery, 5a, Pall Mall East, S.W.1, on January 8th, and remain open until January 25th. It is being given by E. Leitz, the makers of the Leica Camera, and will be entirely of enlargements from negatives made by that popular little instrument. The notable point in regard to this exhibition is that all the pictures are by one man—Dr. Paul Wolff, of Frankfurt, and they are all direct untouched enlargements, measuring about 30×20 . We have already seen a number of these (there are 220 of them) and can say that while many are pictorial masterpieces they are all of magnificent technical quality. The catalogue will give full data regarding the production of each print. It will be on sale during the exhibition at sixpence, and the proceeds will be devoted to the George E. Brown Memorial Fund.

"Zirca" Flashpowder is a new introduction by the firm of Johnson and Sons, already famous for their series of flashpowders. Our tests with the new product show that the makers' claims for it are well substantiated. It not only gives a remarkable flash of high actinic value and quickness, but the amount of smoke that remains even after two or three successive flashes is practically negligible. For these reasons the "Zirca" powder should be ideal

for the Press photographer and the amateur worker at home. It can be fired in any open flashlamp or by means of the touch-paper supplied with it. It is put up in cartons containing two bottles of powder which have to be mixed before use. The mixed flashpowder keeps well, but should be retained in a well-corked bottle. A leaflet of instructions is issued with it which gives full directions for use and approximate amounts for different subjects, plates, films, and lens apertures. Readers wishing to try flashlight photography cannot do better than write to Messrs. Johnson for full particulars. The address is Hendon Way, Hendon, N.W.4.

The new edition of "The American Annual of Photography" has just come to hand. It is again edited by Frank R. Fraprie, editor of our contemporary "American Photography," and is well up to the standard set in previous years. A larger number of page illustrations admirably reproduced are included, and the total bulk of the volume is greater than before. The articles are both numerous and informative, and cover a considerable range of practical subjects. A directory of "American Photographic Societies," a "Who's Who" in Pictorial Photography, and an "American Formulary," render the book of great use for reference purposes. It is supplied in this country by

Sands Hunter & Co., 37, Bedford Street, Strand, W.C., 8s. 6d. paper covers, 12s. 6d. cloth bound.

We have had an opportunity of inspecting the "Hollywood Rolla" Screen which has recently been put on the market by The Camera Company, of 320, Vauxhall Bridge Road, S.W.1. This screen is specially intended for amateur ciné work, but can of course be used for ordinary lantern-slide projection. It has a remarkably brilliant surface, and is very ingeniously made to roll up automatically into its carrying-case. It can be opened or closed in a second or two, and when closed is well

protected against dust, etc. It is made in all sizes, and is inexpensive for this class of screen. The 32×24 silver surface, for instance, is £1 7s. 6d., or glass beaded £3; 40×30 silver is £2 2s., glass beaded £3 18s. 6d.; 52×40 silver £3 17s. 6d., glass beaded £6. A postcard to the above address will bring further particulars.

"The A.P." Monthly Competitions PRIZES AND RULES.

To encourage pictorial outlook and good technique in the photographic work of our readers in all parts of the world.

(I) For Advanced Workers.

This class is open to all amateur photographers. FIRST PRIZE.—One guinea in cash or "A.P." silver plaque (optional).

SECOND PRIZE.—Half a guinea in cash or "A.P." bronze plaque (optional).

THIRD PRIZE.—Five shillings in cash.

A special prize of five shillings in cash for the best mounted picture.

CERTIFICATES OF MERIT.

In addition to the general rules (see below), the following conditions apply:—

(1) All prints must be accompanied by a stamped addressed envelope or wrapper if they are to be returned. Prints receiving an award will be retained.

(2) Prints must be mounted, but not framed.

(3) Returnable prints in the Advanced Section will be sent back with a typed criticism, and classified according to merit.

(4) Prints may be of any size and by any process, and must be the competitor's own work throughout.

(5) The award of a prize or certificate in the Advanced Workers' Competition or any other competition or exhibition will not debar the competitor from entering again on future occasions and winning further prizes.

(II) For Intermediate Workers.

This class is to encourage those readers who have passed the "beginner" stage and may have won an award in the Beginners' Competition, but have not progressed sufficiently to enter in the Advanced Competition.

FIRST PRIZE.—Half a guinea in cash.

SECOND PRIZE.—Five shillings in cash.

CERTIFICATES OF MERIT.

In addition to the general rules (see below), the following conditions apply:—

(1) No print must be larger than 10×8 in., and can be by contact or enlargement by any process, and may be mounted.

(2) The whole of the work (exposure, development, printing, etc.) must be carried out by the competitor.

(3) Prints entered in the Intermediate Section will be criticised and returned if accompanied by stamped addressed envelope or wrapper. Prints receiving an award will be retained.

(4) The award of a prize or certificate in the Intermediate Competition debars the competitor from entering this competition again, but he is then eligible for the Advanced Workers' Section.

(III) For Beginners.

This class is open to those who have never won an award in any photographic competition or exhibition.

FIRST PRIZE.—Half a guinea in cash.

SECOND PRIZE.—Five shillings in cash.

CERTIFICATES OF MERIT.

In addition to the general rules (see below), the following conditions apply:—

(1) No print must be larger than 6×4 in. Contact prints or small enlargements up to this size are eligible, but must be unmounted.

(2) The exposure must have been made by the competitor, but developing and printing may be the work of others.

(3) No prints can be criticised or returned.

(4) The award of a prize or certificate in the Beginners' Competition debars the competitor from entering this section again.

General Rules.

(1) Any number of prints may be entered, but each print must have on the back the appropriate coupon

(see advertisement pages) the date of which must be within five weeks of the closing date of the competition. Overseas readers may use the most recent coupons to hand.

(2) Each print must have on the back the name and address of the competitor, and the title.

(3) All entries must be addressed to The Editor, *The Amateur Photographer*, Dorset House, Stamford Street, London, S.E.1, and the package must be marked on the outside "Beginners," "Intermediate," or "Advanced," as the case may be.

(4) No packages will be received on which there are postage charges to be paid.

(5) No communications on other matters should be enclosed with competition prints. No correspondence in connection with the competitions can be undertaken.

(6) The entry of a print will be regarded as a declaration that it is eligible under the rules, and that the competitor agrees thereto.

(7) No responsibility is taken for the safety of prints, and the Editor's decision on all points connected with the competitions is final.

(8) The publishers of *The Amateur Photographer* shall have the right to reproduce, without payment, any print entered, or to allow its reproduction in any other paper quoting from *The Amateur Photographer*.

(9) The closing date of each competition is the last weekday of the month. Prints arriving late will be entered for the next month's competition.

(10) The cash prizes awarded in these competitions are dispatched on the fifteenth of the month following the announcement of the awards.

The closing date for the December competition is Monday, December 31st, and for the January competition, Thursday, January 31st.

Amateur Cinematography

NEWS, NOTES AND MATTERS OF INTEREST FOR ALL CINEMATOGRAPHERS USING AMATEUR CINÉ APPARATUS.

"Let's Show Our Movies!"

By
R. H. ALDER.

AN eminent statistician has computed that if all the handbooks lost by ultimate owners were placed end to end they would stretch a dickens of a long way.

The essential to a successful projection night is to find the handbook and to follow its advice. A major overhaul is needed only once a season, but driving belts should be examined, the gate cleaned and the feed and take-up mechanism checked over before, and not during, each performance.

Badly kinked flex may blow a fuse—it is not in the best taste to leave your guests in darkness while you grope about the cellar with a candle.

Showmanship.

Films are next examined, weak sprocket holes patched, dirty films cleaned, faulty joins cut out and respliced. Brittle films can be steamed very lightly to restore flexibility by rewinding quickly through the jet from the spout of a kettle—but how much better to have kept them in proper tins!

Having taken these ordinary precautions against scorn, we can set out to win praise. Showmanship is an art very like that of editing—it consists mostly of eliminating dull moments.

What seems dull after brightness may itself seem bright when seen alone. For this reason the programme is arranged so that the poorer pictures (both technically and artistically) come at the beginning.

Increasing Interest.

There is a rhythm in programme building. We cannot expect an audience to maintain intense attention all the time, so our points of interest must be distributed in ascending scale through the evening. The climax comes towards the end, to be followed by a short comedy that releases the accumulated tension.

Although interest is built up in waves it is never relaxed to the degree where it is ost. Arrangements, therefore, are made for smooth, rapid, but unhurried presentation. Distractions of all kinds are eliminated so that the audience is held throughout.

There is nothing so distracting as a flickering coal fire; an opaque fire-screen is highly desirable. Even at night windows are heavily curtained to avoid flashes from passing cars.

Shifting furniture about always causes

disturbance. It is an enormous advantage if the guests can be received in one room and conducted to the already arranged "theatre," just before the performance begins. If one room only is available the order of removal of the table and of placing the chairs should be planned in detail to avoid confusion.

Aunt Tabitha's old bones like a well-cushioned chair at the front; all children, except little girls in party frocks, prefer a rug near the screen.

Hide "the Works."

The screen is covered by curtains with a pelmet at the top; cords and weights, released by an extemporised trigger, draw the curtains as the first title appears. Frequently the window curtains can be used, the screen being mounted with a black surround on the window itself.

A silver screen is inclined downwards as if it were a mirror reflecting light from the projector to the centre of the

auditorium. Many a good show has been spoilt because the operator, standing up at the back, had the brightest view.

The projector is set up beforehand at such a height that the tallest head will not throw a shadow. It is kept hidden in an "operating room" formed of two tall screens; if anyone is interested in the machinery he can see it after the show, not before. The spools are set out conveniently in an open rack.

The position of the projector is such that the operator has ready manipulation of all lighting. Few of us rise to dimmers, but the main room light can usually be controlled by a bed-switch extension as sold for travellers' use.

A twenty-watt lamp, well shaded in a cocoa tin, is arranged to illuminate only the projector table and the gramophone turntable.

The gramophone is a necessary adjunct; unless the ear is drugged with appropriate rhythmic sounds it is

Now is the time to secure good action pictures of flying gulls in the Parks. The amateur cinematographer will find the light ample in the mornings, and plenty of material for attractive films.

irritated by the whirr of the projector. The music, however, need not be too insistent—it is not necessary to drown the cries of your victims.

Musical Continuity.

Records carefully chosen to fit the mood of the screen action can add materially to the emotional effect. Here the electric gramophone with a volume control is an asset, for it is possible to fade out half-way through a record to make a change.

A change of records should not coincide with the changing of spools. A valuable function of music is to form a counterpoint which maintains continuity in the programme as a whole. It can be brought up to full volume when the

screen is empty and faded down again when the next picture starts.

Catching Attention.

An effective introduction is some bold music, such as "The Doges' March" from the "Merchant of Venice" suite, while the room lights are still up. Near the end of the record the lights are switched off and the projector started so that the record is changed on the first set of credit titles.

Towards the end of the programme something cheerful, such as Holst's "Fantasy on the Dargason," before bringing up the lights and coming out of the operating room to receive the compliments of your friends.

When all this has been planned, have

a rehearsal against the stop-watch. Nothing is more upsetting to a good programme than an awkward pause due, perhaps, to a record unexpectedly running out while the film is being changed. The slickness of the theatre is not a matter of expensive accessories, it is got by trying out careful arrangements and sticking to them.

Watch Results.

When the great night comes, if you have any time to spare—few conscientious operators have!—do not look at the pictures save for an occasional glance to see that they are still in focus. Watch the audience. Their attitudes will tell you how successful your work is.

Lighting and Shadows By P. H. BRAITHWAITE.

THE average beginner in cinematography probably gives little thought to pictorial composition in his initial efforts, but experience soon teaches him that with most subjects there is one point of view which is more pleasing than another. He will also learn that it is to his advantage to select his shots only where subjects are correctly proportioned in relation to lighting and shadows.

Correct lighting should give both form and roundness to the picture, making the principal object stand out boldly. This can be achieved provided the light has a good proportion of contrasty shadows.

Without shadows, all objects having form appear flat, and it becomes necessary, therefore, to often "film across the light" to give that object sufficient form to impart realism and

consequent interest. Pleasing results can also be achieved by arranging for the principal subjects to move in and out of shadows.

With lighting coming from a fixed source, as with the sun, the camera must be correctly placed in a position which allows of sufficient shadings being registered in relation to the subject being filmed. If the sun is too high in the heavens to cast any side shadows, filming should be postponed until the sun's position has altered.

Light coming from a point to the right or left of the camera gives ideal shadings. If the sun is in the west, the camera can be pointed N.E. or S.E. to enable both lighting and shadows being correctly registered.

Lighting which comes from directly behind the camera should be avoided, as from this position objects will appear

flat, having no shadows and therefore devoid of relief.

Where heavy shadows occur, these must be allowed for in exposure, otherwise the screened film will be found to be lacking in half-tones, having no graduation. Moving pictures, relying solely upon their portrayal of action, demand considerable differentiation of the actual moving object from the background.

Light striking the principal character or object at an angle of approximately forty-five degrees, both from the horizontal point of view and also in relation to the direction of the camera lens, will bring it out in relief from the background. The object should, of course, be in the plane of sharpest focus. By so doing, the progress of the story is much easier followed on the screen, and interest maintained.

ACTION SUBJECTS for the AMATEUR CINEMATOGRAPHER

The Amateur Photographer and Cinematographer's Diary of Forthcoming Events.

The Week's Meetings

Societies will have their meetings announced here if the syllabus is sent to us at the beginning of the session or from time to time.

Thursday, December 27th.

Coatbridge P.A. Hanging Night for Exhibition.
Hammersmith H.H.P.S. Criticism of Slide Competition. A. Hanson.
N. Middlesex P.S. Nominations. Sending-in Night. Trial of Exhibition Slides.
Oldham P.S. Monthly Meeting. Bi-Monthly Prints.
Singer C.C. G.D.U. Portfolio and S.P.F. Scientific Section Portfolio.

Friday, December 28th.

Harrogate P.S. Competition Evening.
Ilkeston A.C. "British Insects." C. Henderson.
Phoenix Welfare C.C. Annual Exhibition Opens.

Saturday, December 29th.

Coatbridge P.A. Annual Exhibition Opens.
Luton and D.C.C. Exhibition Opens.

Monday, December 31st.

Bexley Heath P.S. "The Amateur Photographer" Prize Slides.
City of London and C.P.S. "The Chemical After-treatment of Bromide Prints."
A. H. Redman.
Leeds C.C. Annual Meeting.

Tuesday, January 1st.

Bedford C.C. E.A.F. Portfolio and Slides.
Leicester and L.P.S. "The Way of the Lovely Sky." Capt. A. G. Buckham.
Nottingham and Notts P.S. "The Chronicles of a Seeker." T. G. Earp.
Portsmouth Camera and Ciné Club. "Infra-Red Photography." Ilford, Ltd.
St. Bride P.S. Enlarging. T. J. Kelly.
Stafford P.S. "Bernese Oberland." J. Eymen.

Wednesday, January 2nd.

Borough Poly. P.S. Informal Meeting.
Brighton and Hove C.C. "Italian Lake and Landscape." J. Dudley Johnston.
Coventry P.C. Folio Discussion Evening.
Edinburgh P.S. "Bring Your Cameras." General Discussion.
Rothdale P.S. "Speed Photography." J. H. Price.
South Essex C.C. Nominations of Officers for 1935, etc.
South London P.S. Ciné Group Meeting. "Holidays at Sea." S. J. Coleman.
South Suburban and C.P.S. "An Hour with the Children." E. J. Bull.

Exhibitions and Competitions CURRENT AND FUTURE

Notices of forthcoming exhibitions and competitions will be included here every week if particulars are sent by the responsible organisers.

The Amateur Photographer Monthly Competitions for Beginners, Intermediate and Advanced Workers.—Entries, December 31. Rules in this issue.

Chicago International Salon.—Open, December 13—January 20. Chicago Camera Club, 137, N. Wabash Avenue, Chicago, Ill., U.S.A.

"Northern" Exhibition, City Art Gallery, Manchester.—Open, December 8—January 10. Secretary, J. Chapman, 25, Radstock Road, Stretford, Manchester.
8th International Christmas Salon of Photography, Antwerp, 1934—35.—Open, December 23, 1934—January 7, 1935. Particulars from Mr. J. Van Dyck, Secretary of the Fotografische Kring "Iris," Ballaerstr., 69, Antwerp, Belgium.

Madrid International Salon.—Secretary, Sociedad Fotográfica de Madrid, Calle del Principe, 16, Madrid, Spain.

Preston Scientific Society (Photographic Section), Open Exhibition.—Entry forms due, January 11; exhibits, January 17; open, January 28—February 16. Secretary, F. Wells, 65, Powis Road, Ashton, Preston, Lancs.

International Miniature Camera Exhibition, for prints and enlargements made from miniature camera negatives.—February 1—21, 1935. Latest date for entries, January 21. Entry forms and particulars from Exhibition Secretary, British Photographic Fellowship, 7, Aberdeen Mansions, Kenton Street, W.C.1.

South London P.S. Annual Exhibition.—Entries,

January 22; open, February 16—March 16. Details and entry forms from Hon. Exhibition Secretary, H. S. Adams, 40, Stockwell Park Road, S.W.9.

Leicester and Leicestershire Photographic Society International Exhibition.—Open, February 25—March 2, inclusive. Particulars and entry forms from the Hon. Organising Secretary, W. N. Plant, 30, Harrow Road, Leicester.

Ilford P.S. Annual Exhibition.—Entries, February 2; open, March 4—9. Hon. Exhibition Secretary, H. G. Haylock, 58, Windermere Gardens, Redbridge Lane, Ilford, Essex.

Birmingham P.S. Annual Exhibition.—Entry forms due, February 9; exhibits, February 12; open, March 2—16. Secretary, E. H. Bellamy, Waterloo House, 20, Waterloo Street, Birmingham.

City of London and Cripplegate P.S. Annual Exhibition.—Closing date, February 11; open, March 11—16. Exhibition Secretary, J. R. P. Hilliard, 86, Downton Avenue, Streatham Hill, S.W.2.

L.M.S. Annual Exhibition.—Entries, February 13; open, March 11—16. Secretary, A. J. Scrivener, Station Master's Office, Euston Station, N.W.1.

Cannes Photo-Club International Salon.—Entries, February 20; open, March 31—April 7. Entry forms from Secretary, Photo-Club of Cannes, Boite Postale, 105, Cannes, France.

G.E. Mechanics Institute P.S. Annual Exhibition.—Entry forms due, February 22; exhibits, March 1;

open, March 12—13. Hon. Exhibition Secretary, W. F. Calcraft, 76, Gurney Road, Stratford, E.15.

Barry C.C. International Salon.—Entries, March 8; open, March 18—23. Secretary, J. H. White, Caerleon, 61, Pontypridd Road, Barry, Glam.

Scottish National Salon (Art Galleries, Ayr).—Entries, Overseas, March 9; Great Britain, March 23; open, April 20—May 4. Secretary, Arthur J. Nelson, 6, Hilary Crescent, Ayr, Scotland.

Brussels International Salon.—Entries, March 15; open, May 7—June 9. Secretary, M. Maurice Broquet, Rue du Sceptre, 77, Brussels, Belgium.

Antwerp International Salon.—Entries, March 15; open, April 27—May 12. Secretary, D. J. de Groote, Van Heystrelt-Straat, 19, Deurne-Antwerp, Belgium.

Bristol P.S. Open Exhibition.—Entry forms due, March 23; exhibits, March 30; open, May 4—14. Hon. Exhibition Secretary, P. V. Cave, 36, Coldharbour Road, Redland, Bristol, 6.

Hackney P.S. Annual Exhibition.—Entries, March 25; open, March 27—30. Secretary, Walter Selfe, 24, Pembury Road, Clapton, E.5.

Nottingham and Notts P.S. International Exhibition.—Entry forms due, March 27; exhibits, April 3; open, April 11—13. Entry forms from W. R. Anderson, 3, Meadow Road, Beeston, Notts.

Bolton C.C. International Exhibition.—Entry forms due, March 11; exhibits, March 18; open, April 6—13. Hon. Secretaries, T. Dobson and T. Trevor Potts, c/o C. E. Willis, Ltd., 87, Bradshawgate, Bolton, Lancs.

"The A.P." Monthly Competitions

AWARDS FOR NOVEMBER.

ALL three classes of the competition for November again reached a high standard of excellence.

This is particularly the case in the Advanced Workers' section. The number of entries also was considerably above the average, and if the same quality is sustained in the New Year serious consideration must be given to the suggestion made by several readers for the formation of yet another class. At present the standard of Class 1 is as high as the Hon. Mention class of a year or so ago, and we congratulate our readers on the general excellence of their work throughout. The awards are as follows:—

ADVANCED WORKERS' SECTION.

First Prize.—"The Tower," by Fred H. Rothstein, 42—14, 214th Place, Bayside, New York, U.S.A.
Second Prize.—"Herring Gull Alighting," by A. V. Bibbings, 54, Queen Street, Newton Abbot, Devon.
Third Prize.—"A Farmyard Study," by F. C. Diemer, Hendefoailan, Blackhall, Edinburgh, 4.
Mentioning Prize.—"Effect," by C. Peters, 46, Fore Street, Redruth, Cornwall.

Certificates of Merit.—"A Sunny Corner," by Hubert M. Bond, Bylands, White Rose Lane, Woking;

"Shunting Yard," by Edward H. Brenan, 12, Avenue Rise, Bushey, Herts; "Rind and Rhythm," by Charles E. Rollinson, Oakrest, Christchurch Road, Newport, Mon.

The prints not receiving awards have been grouped, those in the first group receiving Honourable Mention. The others have been marked Class 1, Class 2, and Class 3, respectively.

Those awarded Honourable Mention are as follows: L. C. Blanchamp (London, S.W.); Ida Brandon (Bedford); Arthur Brook (Builth Wells); J. H. Clark (London, S.E.); N. Crawshaw (Bebington, Ches.); W. Ellison (Carlisle); A. T. Fairbank (Beckenham); H. L. Griffiths (London, S.E.); Sorab J. Kharegat (Bombay); Pierre Muller (Paris); C. D. Notley (London, W.C.); Miss L. M. Orr (Weybridge); Charles E. Rollinson (Newport, Mon.); S. Thompson (Lancaster); (3) Henry Tolcher (Colwyn Bay).

INTERMEDIATE SECTION.

First Prize.—"Farmers, Make Haste!" by J. P. Searight, Pythouse Farm, Tisbury, Wilts.
Second Prize.—"The Gold Fish Bowl," by Miss

Dorothy Squire, Whitby, Marley Road, ay
Tree P.O., Jamaica, B.W.I.

Certificates of Merit.—"South Coast," by George Hilleard, 8, Undershaw Road, Bromley, Kent; "Joie-de-Vivre," by Frank Law, The Boulevard, St. Annes-on-Sea, Lancs; "The Mill House," by Leonard Lewer, N.P. Bank Chambers, Tavern Street, Ipswich; "Harvest," by G. A. Maclean, Heybridge, Prestbury, Macclesfield.

BEGINNERS' SECTION.

First Prize.—"Seagulls," by G. W. Cattermole, 90, Ravensbourne Avenue, Shortlands, Kent.
Second Prize.—"Firework Display," by J. Douglas, 39, Thirlstone Road, Edinburgh.

Certificates of Merit.—"Reflections," by R. F. G. Sandercock, 9, Esplanade, Dover; "Grainard Bay," by J. A. Stirling, 17, Roland Gardens, London, S.W.7; "Searchlight Display by War Vessels in Torbay," by Ronald W. Turner, Mardonien, Hooper Avenue, Pennsylvania, Exeter; "The Young Anglers," by Robert Welburn, Moorside, Norden, Rochdale; "Winter," by W. Owen, 7, Stainbeck View, Meanwood, Leeds, 7.

Readers' Questions ANSWERED

GENERAL.—All communications for the Editor should be addressed: "The Editor, *The Amateur Photographer and Cinematographer*, Dorset House, Stamford Street, London, S.E.1," and in every case, without exception, must give the name and address of the writer.

CONTRIBUTIONS.—The Editor is glad to consider original, up-to-date manuscripts on photographic subjects. All contributions must be typewritten, or in very legible handwriting on one side of the paper only. Letters or communications arising out of matters already appearing in the paper are not paid for. The Editor disclaims legal responsibility for the safety of matter submitted to him, but he will endeavour to return rejected manuscripts, etc., when a stamped addressed envelope is enclosed. MSS. or prints that are not actually accompanied by a stamped wrapper or envelope can in no case be returned. Reproduction fees for prints are only paid by arrangement beforehand. The sending of a print, without any condition stated, will be taken as permission to reproduce it without fee.

ENQUIRIES AND CRITICISM.—Advice, Criticism and Information are freely given, but the following conditions should be read carefully before applying, as any communication which does not comply with the rules must be ignored.

(1) See "General" above. (2) Every question and every print for criticism must be sent separately through the post, and must be accompanied by a separate stamped addressed envelope. No exception can be made in any case to this rule, except so far as enquiries or prints from Overseas are concerned. (3) Neither enquiries nor prints for criticism must be enclosed with competition prints. (4) On the back of each print sent for criticism, in addition to the name and address of the sender, must be the title (if any), and the criticism coupon from the current issue. (5) Enquiries should be clearly written, on one side of the paper only, and should be specific and not general. Such enquiries as "How can I take interiors?" or "Can you give me some hints on outdoor portraiture?" are too general to be dealt with in this section. (6) All envelopes should be distinctly marked "Query" or "Criticism," as the case may be. (7) Prints are sent for advice or criticism on the distinct understanding; that by so doing permission is given for their reproduction without fee. We endeavour to deal promptly with enquiries, but cannot undertake to answer by return of post, nor can we give precedence to any enquiry.

A selection of those replies is printed each week, but all questions are answered by post. Enquiries from abroad must contain a coupon also, but it need not be from the current number, and should be cut from the latest issue to reach the enquirer.

Ciné "Frames."

In the three principal sizes of ciné films is it a fact that the proportion of the "frame," or actual picture space, is not the same for all?

W. E. E. (Ipswich.)

It is not the same. The most marked difference is in the 9.5-mm. film, in which no space at the sides is occupied by perforations. The percentage of space occupied by the frame has been calculated at 65, 69 and 82 for 35-mm., 16-mm., and 9.5-mm. widths, respectively.

Varnishing Labels.

What is a suitable varnish for protecting labels on bottles? F. O. (Dundee.)

We know of nothing better than a couple of coats of celluloid varnish, applied with a soft brush, and going just beyond the edges of the label. The first coat must be quite hard before the second is applied.

Colour Photography.

Can you put me on the track of a cheap, practical book on the subject of colour photography? It must not be "abstruse." E. L. (Whitstable.)

We think that the book most likely to fill your specification is "Colour Photography," by Frank R. Newens, published by Blackie & Son, at 4s. 6d. net. It was compiled only about three years ago, so that it is more up-to-date than some of the "standard" textbooks on the subject.

Differential Focussing.

What is the idea behind the expression "differential focussing"? W. M. M. (Monmouth.)

In some prints, especially those resulting from the use of a short-focus lens, or a small stop, the definition is sharp everywhere. In others, everything is more or less diffused, as in a pinhole photograph; nothing is bitingly sharp. Thirdly, there are the photographs in which certain planes are sharp while

others are less so. As a rule, the definition of the nearer objects is sharpest. This differential definition is secured by focussing on the nearer objects, and not using such a small stop that the distance would be sharpened up also.

Slow Snaps.

At this time of the year it is necessary to give longer exposures than in summer; what is the slowest speed that can be safely given with the camera in the hands? S. E. (Harlow.)

There is no definite answer to your question. Much depends on the size and weight of the camera; more on the type of shutter, and the way in which it is fired; and most on the photographer. Some photographers can manage a full second; others are uncertain at 1/10th. It is perhaps unnecessary to remind you that when circumstances suggest a rather long exposure the use of a tripod is almost always practicable, and certainly desirable.

Pinacryptol Green.

I have been given a gramme of pinacryptol green, but am at a loss how to make a solution of the required weakness. Will you tell me the procedure? T. B. (Hull.)

The working solution is made from a stronger stock solution. Dissolve your crystals in 17 oz. of warm water, filter, and put into an opaque bottle. For use take $\frac{1}{2}$ oz. of this and 10 oz. of water.

Black Margins.

How does one get black borders on prints by cutting away the gelatine from the plate? W. R. (Jersey.)

Apparently you are using glass negatives, and in that case you can print black borders by cutting away the gelatine from the edges of the negative. By means of a steel rule and a sharp knife you make a thin cut through the

gelatine near the edge. The gelatine left between this cut and the edge is then scraped away carefully. If you make arrangements for exposing the whole of the plate you will get a black edge, which can be afterwards trimmed down to a narrow width. With films the blank edges can be trimmed off and the film sandwiched between clear glasses so as to leave a space all round it.

Glazing.

Can you tell me what is the cause of prints sticking to glass when rolled on for glazing? I have tried several ways of cleaning the glass.

S. H. (Gosport.)

You must understand, first of all, that the glass on which you put the prints must be absolutely clean and highly polished. You should then, after the final washing, put the prints for three or four minutes in formalin solution, one part of commercial formalin to nine or ten of water. This hardens the prints, and if you transfer them straight from the solution to the glass they should come off easily when dry.

Toning Ciné Films.

I wish to try my hand at toning short lengths of ciné film to a warmer colour. What method do you suggest? A. Y. (Deptford.)

We do not think you can do better than to try Ferguson's copper toning, as this gives a range of tones and practically leaves the density unaltered. Make up two solutions:

| | | |
|---------------------------|--------|---------|
| A. Copper sulphate | .. | 7 grs. |
| Potassium citrate | .. | 28 grs. |
| Water | .. | 30 oz. |
| B. Potassium ferricyanide | 6 grs. | |
| Potassium citrate | .. | 28 grs. |
| Water | .. | 30 oz. |

Take A, one part; B, one part; water, two parts. As soon as the colour becomes warm enough, wash thoroughly.

Aerograph.

Having tried local dealers without success, can you tell me where I could buy an Aerograph, and give me an idea of the price? H. M. F. (Perth.)

You are not likely to get an aerograph from local dealers. The makers are the Aerograph Co., Ltd., 43, Holborn Viaduct, London, E.C.1. The prices vary considerably, according to style and equipment.

Stops.

I have a camera with a Bausch & Lomb lens, and the stops are marked, 4, 8, 16, 32, 64, 128. Are these f/ numbers? R. D. (Penge.)

The stop numbers on your lens are according to the Universal System, and are 8, 11, 16, 22, 32 and 64 respectively.

Action of Developers.

What is the chief developing property between a pyro-soda and metol-hydroquinone developer? L. B. (Exmouth.)

We are at a loss to grasp the meaning of your question. Although pyro-soda and metol-hydroquinone act in a somewhat different way, the result is the same. The action reduces a certain proportion of the exposed silver salts to the metallic state, and in a general way there is nothing to show whether a negative has been developed with one reagent or another.

Unusual—'New Angle'—Dramatic pictures
are easy to get with the

Retina

KODAK'S NEW
MINIATURE CAMERA
FOR 35 MM. FILM

£10.10.0

The Schneider f3.5 lens and "Compur" Shutter (1-1/300th second) free you from hampering restrictions of light and subject. The whole exciting world of night-time photography, for instance, is readily yours with a "Retina"—indoors and out.

The "Retina" is so economical. It gives you 36 pan-chromatic negatives for 3/6—hardly more than a penny per picture. You can "shoot" freely with the "Retina"—and so multiply your opportunities for getting fine pictures. You can take the "Retina" with you everywhere—it measures only 4½ by 3 by 1½ inches—and snap up the sudden unlooked-for picture chances that wait round every corner.

- How about a "Retina" for Christmas?
- Ask for the free "Retina" Booklet, "The World at Your Finger-Tips."

Half Bound Leather
10/6 net By post 11/-

"Photograms of the Year," the new edition of which is now on sale, is a most attractive annual for all who are interested in pictorial art.

Containing nearly eighty superb reproductions, selected from the best work of the world's leading photographers, this volume reveals the remarkably wide range of subject matter that comes within the scope of the modern camera artist.

Still-life, landscape, portraiture, posed figures, architecture and the artistic interpretation of apparently commonplace detail, are all presented with consummate taste and technical skill.

Obtainable from leading Booksellers, or direct from the Publishers

ILIFFE & SONS LTD., DORSET HOUSE, STAMFORD STREET, LONDON, S.E.1

PLEASE MENTION "THE AMATEUR PHOTOGRAPHER" WHEN CORRESPONDING WITH ADVERTISERS.

Business Notices

Publishing

OFFICES.—Dorset House, Stamford Street, London, S.E.1. Telegrams: "Amaphot, Watloo, London." Telephone: Hop 3333 (50 lines).

PUBLISHING DATE.—"The Amateur Photographer and Cinematographer" is on sale throughout the United Kingdom every Wednesday morning.

CANADA: Imperial News Co., Toronto, Winnipeg and Vancouver; Benjamin News Co., Montreal; Gordon & Gotch, Ltd., Toronto. SOUTH AFRICA: Central News Agency, Ltd.

Displayed Advertisements

Communications on Advertisement matters should be addressed: The Advertisement Manager, "The Amateur Photographer and Cinematographer," Dorset House, Stamford Street, London, S.E.1. Copy for displayed advertisements for the issue of any particular week must reach Dorset House by the first post on Tuesday morning in the week previous. Rates and conditions will be sent upon application.

Prepaid Advertisements

SALE AND EXCHANGE: AMATEURS ONLY—

12 words or less 1/-
1d. for every additional word.

PROFESSIONAL AND TRADE:—

12 words or less 2/6
2d. for every additional word.

Each paragraph is charged separately.

SERIES DISCOUNTS are allowed to Trade Advertisers as follows on orders for consecutive insertions, provided a contract is placed in advance, and in the absence of fresh instructions the entire "copy" is repeated from the previous issue: 13 consecutive insertions, 5%; 26 consecutive, 10%; 52 consecutive, 15%.

All advertisements inserted in these columns must be strictly prepaid and posted to arrive at the Head Office, Dorset House, Stamford Street, S.E.1, not later than first post FRIDAY for the following week's issue, or one day earlier at the Branch Offices, 19, Hertford Street, Coventry; Guildhall Buildings, Navigation Street, Birmingham, 2; 260, Deansgate, Manchester, 3; 26a, Renfield Street, Glasgow, C.2.

Advertisements are inserted, as far as possible, in the order received, and those received too late for one issue, or crowded out, are published in the first following in which there is space. The Proprietors retain the right to refuse or withdraw advertisements at their discretion.

Postal Orders sent in payment for Advertisements should be made payable to ILIFFE AND SONS LTD., and crossed

Notes being untraceable if lost in transit should not be sent as remittances.

The Proprietors are not responsible for clerical or printer's errors, although every care is taken to avoid mistakes.

BOX NUMBERS.—For the convenience of advertisers, letters may be addressed to numbers at the office of this paper. When this is desired, the sum of 6d. to defray the cost of registration and to cover postage on replies must be added to the advertisement charges, which must include the words: "Box 000, c/o 'The Amateur Photographer'." Replies should be addressed: "Box 000, c/o 'The Amateur Photographer,' Dorset House, Stamford Street, London, S.E.1," and these letters will be simply forwarded by us to the advertiser. It must be understood that we do not deal with the correspondence in any other way, nor accept any responsibility in connection with the advertisement. Readers who reply to Box No. advertisements are warned against sending remittances through the post except in registered envelopes. In all such cases the use of the "Deposit System" is recommended.

Special Note

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post. When sending remittances direct to an advertiser, stamp for return should also be included for use in the event of the application proving unsuccessful.

Deposit System

Readers who hesitate to send money to advertisers in these columns may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Amateur Photographer and Cinematographer," both parties are advised of its receipt. The time allowed for decision is three days, counting from receipt of goods, after which period, if buyer decides not to retain goods, they must be returned to sender. If a sale is effected, buyer instructs us to remit amount to seller, but if not, seller instructs us to return amount to depositor. Carriage is paid by the buyer, but in the event of no sale, and subject to there being no different arrangement between buyer and seller, each pays carriage one way. The seller takes the risk of loss or damage in transit, for which we take no responsibility. For all transactions up to £10 a deposit fee of 1/- is charged; on transactions over £10 and under £50 the fee is 2/6; over £50 and under £75, 5/-; over £75 and under £100, 7/6; and on all transactions over £100, one-half per cent. All deposit matters are dealt with at Dorset House, Stamford Street, London, S.E.1, and cheques and money orders should be made payable to Iliffe and Sons Ltd.

WARNING

We have received many complaints from our readers in regard to the business methods of Mr. R. L. Green, trading as R. L. Green's Photographic Exchange, of 218, Fore Street, Edmonton, London, N.18.

For some considerable time we have refused to insert his advertisements in "The Amateur Photographer and Cinematographer," and from the complaints we have received it would appear that his practice is to communicate with private advertisers having goods for sale, offering to take such goods in exchange for others, or to purchase for cash. Readers are advised to ignore all such offers from this quarter.

CAMERAS AND LENSES

ZEISS Ikon Super Ikonta, with distance meter, No. 520, for 16 pictures 2 1/2 x 1 1/2 on a 3 1/2 x 2 1/2 roll film, fitted Zeiss Tessar f/3.5, Compur delayed-action shutter, £16/12/6; Ditto, ditto, fitted Tessar f/4.5, £17; Ditto, ditto, 530/15, 4 1/2 x 2 1/2 on 16 pictures 2 1/2 x 2 1/2, fitted Tessar f/4.5, D.A. Compur shutter, £18/15.

DEFERRED Payments are arranged upon the following scale in approved cases: 20 per cent of the value of purchase at the commencement of transaction, the balance over a period of from 6 to 12 months, as arranged. Two references required, either householders, employer or bank. With instruments purchased in part exchange the difference in value is considered the purchase price.

WHERE these arrangements are complied with there will be no addition in the purchase price for deferred payments.

NO Sale Lists issued; enquiries by post will receive prompt and careful attention.

EXCEPTIONAL Deferred Payment Terms; Repairs by experienced workmen; estimates free by return post.

DEVELOPING, Printing and Enlarging, our speciality; best possible results guaranteed; quick service.

HAND CAMERAS

Third Edition

By **R. Child Bayley**

AN outstanding feature of this book, which makes a special appeal to all amateur photographers, is a number of separately printed plates, all from hand camera negatives by the author. These are selected to show the very wide range of subjects accessible to the snapshotter, from pure landscape to tele-photographic portraiture.

Though primarily written for the beginner, "Hand Cameras" contains much of interest to the advanced worker, and should be in the working library of all who would attain to the highest degree of artistic excellence in their work.

PRICE 3/- net

By post 3/3

Obtainable from leading booksellers or direct from the publishers:—

ILIFFE & SONS LTD.

Dorset House, Stamford Street, S.E.1

ALL THE LATEST CAMERAS

can be purchased at **ALLENS**, including:

KODAK RETINA, ZEISS IKOFLEX, ROLLEIFLEX, ROLLEICORD, SUPER IKONTA, LEICA, CONTAX, EXAKTA, etc., etc., and you will receive approximately two-thirds allowance on your present apparatus, if modern and subject to our approval.

See Second-hand Bargains in Cameras and Lenses column.
